Thanks, Bill. I'll check that. I'm not sure what the mark/space does. I presume it is different than parity and stop bits, though....

Thanks, Mark.

When I set the mode in the program to, say "Packet 300", I get a reply from the tnc (MFJ-1278) stating the mode (HF Packet) and the baud (300). I presume that means the tnc is set correctly. Or, do I need to be doing something else?

I do not have Packet 6.2.

Thanks,

Dale

3. AEA/Timewave DSP-232 Y2K Compatible?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-01 00:00:00 UTC
From: ralphmw@aol.com
Message-ID: <20000101003759.10207.00000233@ng-fs1.aol.com>
Source record: 14787

Happy New Year,

I just turned on my DSP-232 with Version 7.1 firmware a few hours after 0000Z and it didn't want to work. I tried PC-PakRatt, PK-TERM99 (1.4), XPCOM, and even the Terminal program in Windows 98 and all I got was gobbly-goop. My first impression was that the baud rate bewtween the computer and DSP-232 wasn't correct but a check of the system was everything matched. I did a hard reset several times and did get PK-Term99 to talk to the DSP-232 until it locked up & started with the random characters again. I will check the manual in the morning & recheck things. Just wondering if anybody else had this happen.

Cheers,

Ralph NH6QT/3

Ralph,

I brought a DSP-232 home this weekend, and I found the same type of issue. What it looks like happened is that it turned into 7,E,1 after midnight.. really wierd. 7,E,1 will give you the strange characters on the screen.

I'll give Randy at Timewave a call and see what he knows about this. But from what I saw, it looks like something to do with parity and Y2K. :(

Hi Rick,

Thanks for the info. At least now I know where to get started and hopefully get my DSP-232 back to semi-normal. It may have been born with glitches but it sure is nice on RTTY. Happy New Year & 73's.

Ralph NH6QT/3

Mine looks OK this morning. Worked at 8/E/1, and I've got the upgraded
firmware (dec 98) from Timewave. I'll check Monday at the office on a
DSP-232 with the old firmware and see if it runs into the same problem.

I did a soft reset too, in addition to the hard reset.

PkTerm and PakRatt know it's 2000. So no worries. Thanks for the report on the DSP-2232. I'll let Randy know about the mailbox roller problem. Glad everything is up and working.

Rick, Ralph, et al,

After I read your posts, I turned on my DSP-232. Started PC PakRatt ver. 2.1 for Windows 3.1. (computer OS is Win98). I did not change any settings. The DSP-232 initialized normally. I connected to the local DX Cluster and then switched to Baudot and copied the first signal I heard on 20 meters. I then changed to PK-TERM'99 and the results were identical.

In command mode, I tried the DAytime (date and time) command. The date and time displayed correctly in (01-Jan-00 17:19:21). I don't know if 00 means 1900 or 2000 - I have to check that later.

The PC to DSP-232 parameters are Tbaud = 19200, AWlen = 8, PARity = 0. (Use the command DISP A (asynchronous port parameters) to show the values.)

My DSP-232 is connected to COM 3, which happens to be a serial port adaptor on the USB bus.

My DSP-232 firmware is the 12-21-98 release.

Happy New Year!

Randy Gawtry, K0CBH
Timewave Technology Inc.

Hi Rick (& others),

Fired up the DSP-232 this afternoon, did another hard reset and it started to work fine. Copied some 20M Pactor & RTTY signals just fine. I did this with XPCOM & PKTerm99 (Version 1.4 & 1.4a). No problems now. Wierd!!! Thanks again Rick for the help.

Ralph NH6QT/3

Good to hear!

MultiComm Host for Packet is ready will be out as soon as MFJ signs the OEM agreements. MultiComm Host MultiMode will follow soon after.

A 'known bug':
MacOS 9 causes the scrollbar in NET/Mac's online-help to disappear...

Dick KD5VU reports:
A work around that seems to work is to get NET/Mac HELP active, select a
visible item, then do about 10 NEXT-clicks and stop on the 'addmenu Command'. You can then
access the topics with a scroll bar

Happy New Year!

You might care at the end of February, since this is a leap year and
1900 isn't. Be sure to check date-critical equipment on the 29th to
make sure it doesn't think it's the 1st.

Of course, leap year problems are more likely in equipment that is
y2k-aware than in equipment that isn't. Programs that just use a 2-digit
year number and the simple "any year divisible by 4 is a leapyear" will
work just fine. Otoh, when a "clever programmer" who "knows that there is
something different about century years" got his fingers on the program,
it may fail.

23. FCC 5 WPM test requirement :-)

Date: 2000-01-02 00:00:00 UTC
From: kf4sir@earthlink.net
Message-ID: <38705e2b.9271066@news.earthlink.net>
Source record: 14807

Hi all, is anybody else out there as happy as me about the new FCC 5 WPM test requirement for upgrading to HF?

I got into ham radio in the first place because of my interest in the digital modes but found learning morse code to be very hard for me.

I put in over 1 1/2 hours per day 7 days a week for 6 weeks straight trying to pass the 5 wpm test. Because of my schedule and other interest I can not picture myself ever passing the old 13 WPM test required for General.

I became very discouraged after failing my first test at morse code and lost all motivation on upgrading.

The new FCC requirement gives me hope and I believe I might be able to eventually pass the 5 WPM test.

We all have things we are good at; however, a morse code ear is not one of mine.

Some observations:

I find Farnsworth to be much harder to learn than plain slow code.

Using a paddle and a MFJ 1278b I was able to learn to send better than I can receive.

I actually love the history of morse code and would like to be able to use it but I can't picture myself being able to be good enough to do much with it.

Maybe it has something to do with that crash I took on my mountain bike. Must have knocked something loose upstairs ;-)

Trying to identify. I have 3 of these and the only info on them that
appears meaningful is:

Model # FuF1848A
On the rx(?) circuit board 84D80949T01
On the tx(?) circuit board 84D80199M01
On the Eprom FRN4008A, V1.0 Mod B7

The front panel has a 2 digit channel LED
It has indicator lights (Tx/Bsy, Call, Scan)
It has pushbuttons (System, Subfleet, Phone, Scan, Select)

The front panel is labeled: MaxTrac 800

Barcoded on the chassis side is: HUF3037A.

The unit was made in Israel.

Can anyone give me technical info on the unit? It has got to be good for
something, right????

For the single purpose of passing the 5wpm test, there is absolutely
no reason to use Farnsworth anymore.

Although not a DSP-2232 issue, I can confirm that PCPakratt ver 2.0 has at least a minor date-type bug in it. Mine started up with my PK900 on Jan 1 with a "date/time argument error" message, but once past that it seems to work fine. I will be installing PKTerm99 today to eliminate further problems (I hope...).

True for 2000 but not true in general. Hopefully by 2100 Timewave will have a new model to replace the PK-232 :-)

Note: years ending in "00" must be evenly divisible by 400 to be a leap-year.

Hello Red,

My DSP-2232 fired up this morning 02/21/00 with PC PakRATT/WIn 2.1. There is a Y2K problem with 2.0. You will get a "BAD COMMAND ARGUMENT" window when it tries to load the date. That is fixed in ver 2.1 of PC RATT/WIN. I've also tested PK TERM 99 on the DSP-2232. No problems thus far.

PakRatt 2.1 and Pkterm '99 are both Y2k compliant. Once of the reason we purchased PakRatt source back in March was to make sure there were no Y2K issues.

Software for doing this for both SSTV and PSK31 is easy to find.
Check out NB6Z's excellent website, which has links all over the
place. LOGGER is an excellent program for PSK31 which works with the
soundcard, and it is free.

JVComm32 works for SSTV on the sound card. A fully functional demo
version may be downloaded from their website.

There are programs that will work with RTTY and Pactor 1, but I am not
familiar with their specifics, sorry.

Hope this helped.

It was always a test stresser. You didn't know if the examiner
was going to use Farnsworth or not. In my case I learned
Farnsworth from the Gordon West tapes, and took the test
from a guy who used slow code. I have to tell you, It took me
a couple of seconds to re-tune my brain, and I missed the
first callsign letter after the V's to warm you up. I asked myself:
what is that! Oh V, holy smokes that's slow...

The Farnsworth keeps you going in a smooth manner, but the
slow code puts you to sleep :-)

I agree that the point is now academic, but those who really want
to learn code should use Farnsworth. Those that don't should
learn slow code. The reason is the Farnsworth training get's you
over the hump, where as the 13 spaced 5 is sped up to 13 spaced
13 you will learn words faster. You don't listen for letters at 13/13
anymore, or you shouldn't.

The new rules have created a new hobby. Now, if everyone goes out
and buys an SSB rig we will have still failed.

Wonder how the hundreds of thousands (millions?) of hams managed to
learn high speed code before Farnsworth was invented?

38. Pactor and FT-847 and PK-232?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-02 00:00:00 UTC
From: jflanders2@home.com
Message-ID: <386fda03.203254085@news>
Source record: 14822

I can't seem to connect with the pactor MBO stations with an FT-847 + PK232. Is there some trick to this combo? I have only used FSK radios before, and this is an AFSK setup

I can set up his freq properly. After calling an MBO and timing out, I can hear the MBO station trying to respond to my call for awhile until he gives up on me. I can copy other stations in pactor ptlist, and the MBO obviously hears me and tries to connect, but my PK-232 is obviously not connecting with him.

Any ideas?

FYI - This is a new setup and this FT-847 has never been used on pactor before. The PK-232 has, though, using FSK with an ICOM 706.

The objective is to set up an FT-847 with my PK-232 for pactor operation with the winlink stations so I can email while on the road in the camper.

TIA

Jerry W4UK

Source record: 14823

Your point is noted. Maybe I can offer the story I was told. There was some studies I understand, which showed the relationship of hearing tones and deciphering what they were. A normal person can hear morse, and right down a letter up to about 10 WPM (+/-). That's why 13 WPM was chosen.

So there was two schools of thought. You could slowly ramp up to speed, but there was a big hurdle to get over the brain processing hump. That's why so many people fail. The other was, you could send at a speed higher than the brain could process individual characters, but then pause to let it catch up. There was no hurdle, you just closed the gap from 13/5 to 13/13.

So I think the answer to your question is, that those who did it before the brain was understood, did it the hard way. But the effect was, that most people failed. Thus, Morse Code was seen as a difficult skill, with some people just being able to break through the hurdle through the hard work of practice. Farnsworth was supposed to solve all those problems. Don't think it was any more effective at producing increased numbers of ditty-boppers.

I don't know if 73 Magazine is still published, but the editor seemed to think that just listening to 20 WPM tapes, and each day picking out more letters was the way to go. He had accounts of many people learning code that way in less than a week.

LogWindows 3.06.50 released

Program available January 5, 2000

Muscle Shoals, Alabama. January 3, 2000: Creative Services Software announced today that the first update to LogWindows, version 3.06.50 will be released on Wednesday, January 5, 2000.

LogWindows was created in 1994 by Ira Chavis, WA1W and had been distributed in the past by AEA, Timewave and SCO. The program interfaces with all of the CSS TNC host mode programs including PacTerm '98, PKTerm '99 and MultiComm Host.

CSS is selling the program through dealers and direct sales.. The program will retails for $49.95. CSS is offering upgrades to current users of the program for $25.00, as well as a competitive upgrade from other logging programs for $35.00.

"If someone purchases or upgrades to LogWindows 3.06.50 now, they'll not only get all the future 3.x upgrades, but also a FREE upgrade to the 32 bit version of LogWindows when it becomes available", said Rick Ruhl,. President and owner of Creative Service Software.

Creative Services Software is at http://www.cssincorp.com
Windows, Windows 95, Windows 98 and Windows NT are Registered Trademarks of Microsoft Corporation.

48. Re: Pactor and FT-847 and PK-232? PROBLEM SOLVED!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-03 00:00:00 UTC
From: jflanders2@home.com
Message-ID: <38712854.288851746@news>
Source record: 14704

Problem solved. Kim, WB4LZQ had run into this problem before and
recommended I reduce the value of the coupling/blocking cap
recommended by Yaesu. They recommended 10 uFd. Reducing this to 0.22
makes it work well. Apparently the larger value results in a large
time constant slowing the PTT action, and reducing it speeds things
up. Got similar advice from "Billy" on the FT-847 bulletin board.

Thanks for the help, guys.

49. Pactor II sked anyone?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-03 00:00:00 UTC
From: Seth Miller <sethmillerXXXX@email.com>
Message-ID: <387151B1.5C389F45@email.com>
Source record: 14705

Looking for anyone interested in scheduling some Pactor II contacts. I would like to do some experimenting with this mode (QRP, etc.), but I have found that you can call CQ in Pactor II until the cows come home with no results. It's a shame that the entry price for this mode is a mite high
as the performance is truly incredible, and contrary to my expectations has lived up to the hyperbole. Kind of fun to work stations that you cannot hear above the noise floor. I was working a ZS station the other day on 20 meters (at _25_ watts on my end) and had someone who apparently couldn't hear us come up and call a nice long CW CQ. Very strong signal, almost directly on channel and slamming my AGC. Since the far-end station was barely above the noise floor I thought for certain that my contact was over, but the Pactor II connection didn't even slow down... the DSP was apparently able to completely ignore the QRM and the reduced receive signal level. I know, I wouldn't have believed it either if I hadn't seen it myself...

Anyway, if you are Pactor II-capable and are interested please reply to the above address (removing the 'XXXX'). Please do not reply to the newsgroup as I do not check in all that often. DX stations preferred, or stateside OK if you don't have a decent antenna system - otherwise it will be too easy... :)

Thanks & 73,

- Seth N6BMB

Which equipment are you using? I am seriously considering the SCS PTC-IIe for Sailmail and Winlink. Your report is incouraging. When I can choke down the seven bill price, I'll join you from the Caribbean. (Not exactly South Africa but beggers can't be choosers.<g>).

51. RTTY tuning aid

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-03 00:00:00 UTC
From: Rick Mintz <Rmintz@Frontiernet.net>
Message-ID: <84rpc4$187k$1@node17.cwnet.frontiernet.net>
Source record: 14707

Hi RTTY'ers,

I am currently using a HAL P-38 RTTY modem for RTTY, but feeding audio to
an old PK-232 for tuning. I do thing because the vertical LED segments make
for faster RTTY contest tuning than software driven, on screen indicators.

I would like to have a larger vertical LED display than the PK-232 offers.
Anyone have a circuit or source for such a device? (I have seen the stand
alone HAL display, but don't want X-Y indicators). Ideally a 1-2 inch LED
display size would be perfect. I don't have the electronic expertise to
dismember the PK-232 so as to isolate the display portion of the circuit.
Any ideas???

Thanks and Happy New Year.

I was advised that an email that I sent earlier contained
the virus HAPPE.EXE. You may have been infected. The site
http://www.symantec.com/avcenter/venc/data/fix.happy99.worm.
html contains a program that will remove the virus from you
system.

Do not execute HAPPY.EXE. REMOVE IT.

(Thanks to Tim, KG2NO, for the removal link)

Sorry for any inconvenience. I have no idea how this
occurred.

Wow Seth.. great story... and a good argument supporting the idea of
LPI (low probability of intercept) if the PTC-II controllers at
each end of the link could also do automatic power control in
order to stay at some minimum power level for x% acceptable
bit-error-rate!!

Sorry, but I don't as yet have PTC-II capability as yet, but am
bookmarking your e-mail address for later!! ..

Trish

54. AEA MacRATT/PK-232 Software Y2K Glitch

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-03 00:00:00 UTC
From: Richard Kriss <kriss@spec.com>
Message-ID: <kriss-CBBE5D.18224003012000@[192.107.149.20:119]>
Source record: 14710

Heads-Up MacRATT users. I just tried to use my old MacRATT version 2.1 packet program. It still works; however, I suspect a Y2K glitch as it will no longer let me set the PK-232MBX clock. When I issue the command 'Set PK-232 Clock' (under the Control menu), MacRATT comes back with a nag note saying:

The command DAYTIME could
not be executed because
the arguments were invalid

I can issue the DAYTIME command from the Command line; however, it does not set the clock. I had to quit MacRATT and go into the manual terminal mode to set the clock.

Anyone figured out a fix? Yes, I know AEA is no longer in business.

>no reason to use Farnsworth anymore.

Actually Cecil, many of the VE teams will probably continue to test with
Farnsworth spacing on the code tests. I also note that people who learn code
the Farnsworth way seem to do slightly better passing the exam.

I also note that unless the VE team actually won't accept a code exam done this
way, one on a 5 wpm test, could write down the dihs & dahs as they come, then
figure out what letters and punctuation they were while answering test
questions, or putting down what was sent if the exam team counts the number of
correct characters received. Of course, I also expect that some vengeful folk
will begin to insist on the sending test again too, just to be nasty as it
appears unnecessary.
Actually, I think I'll check the new rules, they might only insist on 5 wpm
received, and if so, just learning to write down the dihs & dahs would work for
5 wpm.
Hopefully some of the folk more interested in experimenting than in cw will
become hams, especially young folk.

That's just great since Farnsworth violates the Morse code timing specs
listed in the ARRL Handbook.

The sending test is easy. We still have it in Australia. With a little
bit of practice, if you can receive it sending is easy (unless you get
nervous on the day).

You may have some of the parameters set wierd on the 232. Some of the
default settings are sub-optimal. It may not have mattered for AFSK
but it may matter for FSK. Check your parameter settings methodically
with the manual -- it sounds like you may have one set screwy.

You might want to chec the following items...

1. Make sure that you are set up for PTT operation.
VOX and ARQ modes do not mix. I doubt that
this is the problem but have to ask....

2. Make sure that the AGC on the radio is set to FAST.
In SLOW you are guaranteed problems.

3. Check the PK232 settings for PACTOR. There
are several delay settings that may have to
be adjusted for the new radio. Consult
the PK232 users guide for the exact comments.

It's not "reinventing the wheel" - writing your own software
provides exactly the same feeling of accomplishment,
understanding and just plain fun that building your own
hardware (e.g. radios) provides.

It's an interesting point though. I just saw a ham on another newsgroup
propose that since CW requirements are being reduced by your FCC,
the bandwidth allocated to CW could also be decreased.

Digital modes are finding it hard to bandwidth. PSK31 is generally found
around 14.070 MHz but this area is used by PACTOR stations. PSK31
is a very narrow mode which encourages low power use and is for
keyboard to keyboard QSOs, and so it is not really compatible with PACTOR
which typically seems to invole a lot of power, and contacts with BBS
stations and the like.

Similarly MT63 is a wideband digital mode; uses about 1 kHz in the default
mode (can use 500Hz or 2kHz; each has different amounts of robustness).
MT63 still hasn't found a really solid home because the US regulations
only talk about narrowband digital modes like RTTY and packet, and
not wider modes like MT63. So it doesn't seem to fit in any part of the band.

Yet these digital modes are where real HF experimentation is taking
place, not the phone segment.

Hello,

I recently added a PREFIX look-up form on the QSL page. If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

You are invited to http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

73!

To Start off, I am not picking on Mr. Coleman, he just started the thread and after reading the replies, what follows is my opinion of the whole Code versus No Code affair.

Additonally, I am not a "Code Freak" (i.e. FISTS member, etc.) but what I can tell y'all is this. If one tries to learn the code by memorizing let say the letter A as DIT DAH from a sheet of paper rather by listening to it's sound, they are not going to pass the code test. I learned this from my experience years ago!

Also attitude is everything, Mr. Coleman sets himself up for failure, just read his POST, which is typical of most reduced code or code-free posts read to date, "found learning morse code to be very hard for me.....I can not picture myself ever passing the old 13 WPM test.....etc."

I just took my father (age 65) for his no code test three weeks ago, he only had 8 days of 1/2 hour each with about 1/2 the letters learned, and said he thought the test would be easy. The man had not heard (now mind you heard) code in over 20 years since I moved away from home up to that point in time.

Further more, if one can learn the melody to a song, which with few exceptions most people can, then one should be able to learn the code. A song is a more complicated pattern to learn than the code, in fact a bird learn songs to communicate with so why cannot a Human learn the code? After all the bird's brain compared to a Human's is like comparing a Cray to a Palm Pilot!

A lot of posters wrote about college and technical school educated people wanting to be ham, but cannot learn the code. Obtaining my ASEE and BSEE degress was on hell of a lot hard to do than learning the code, especially compared to the days when the test givers where FCC Federal Radio Inspectors whose goal was to fail as many people as possible versus the VECs' Nice Guy VEs.

What all this sounds like to me is a time management rather than a learning problem. Everyone has so many other things to do in their lives they just do not have the time in reserve to learn the code.

I say this let us cut through the BS and someone petition the ITU to just do away with Ham License tests all together. Send you bucks to your countries government communications agency, they issue a call Sign. This solves any time management or learning problems in one nice neat package.

Everyone would have equal access based soley upon base their economic means to purchase the required accessories and radio equipment.

Better yet maybe incentive licensing should be economically based, which would be a win-win situation for all, especially the governments who could rake in more buck for more privilges.

86. OS Packet operators in the US

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-04 00:00:00 UTC
From: Basque <hotcowgirl@snowcrest.net>
Message-ID: <84ten6$be4$1@news.snowcrest.net>
Source record: 14721

Hi All

Here's a good question that doesn't seem to have an answer

For a visiting Overseas Operator to the US wanting to use packet, how should they identify themselves??

ARRL extract --->
Foreign Amateurs who wish to operate in the United States may do so if the country with which they are a Citizen and Amateur Licensee has entered into a reciprocal operating agreement with the United States. Such agreements can include a Reciprocal Licensing Agreement, or CEPT license, or IARP permit. No additional permit is required -- simply bring your original license, issued by your home country, when you visit the US; and be sure to identify your station while operating in the US by giving your call sign followed by the appropriate US call district identifier (e.g., W3/G1ABC).
End--->

Now the above is great for voice communication, but there would be no way for me to enter my call of ZL1TSC/W6 into my TNC as MYCALL. I could use CWID, or the HID to identify myself, but anybody on the system who does a "mh" will only see ZL1TSC, as that is the call sign attached to my transmissions. I have asked around the various operators in the district that I am in, but nobody seems to have a definitive answer :-(

Would love to hear your thoughts, as I have my packet station all set up, but don't want to upset anybody with misleading packet addresses

Cheers & 73

Phil ZL1TSC/W6

I recall seeing this come up before and the recommendation was to use
your assigned callsign in MYCALL and your callsign with the US area in
BTEXT, so it will be beaconed. I believe the current requirement is to
put the W6 before your call instead of after (except for Canadian hams
where the US area should be put after the call, since it is defined
that way by the reciprocal agreement.)

You should also set BEACON EVERY 60.

Hi Phil,

I had the same problem some years ago when operating /MM on Packet. The best way is to beacon your full callsign regularly and give QTH details in the beacon text.

HTH,

Don't use MYCALL - see if you have a MYPTCALL and use that.

With the PK-232 (PACTOR ROMs V7.12), Quoting from the manual p 11-2:

"MYCALL does not allow punctuation other than the dash (-). MYPTCALL
does allow punctuation in the call. This allows you to properly
identify when operating portable, e.g. MYPTCALL ZL2/K6RFK."

I just discovered this yesterday while actually reading the manual
(rare event here) to solve another problem I had. I also have had
problems identifying properly in Canada on PACTOR and was pleased to
find this.

I haven't tried it yet, but it appears that if I enter a MYPTCALL but
no MYCALL, the PK-232 will use the MYPTCALL entry for the callsign.
This seems to apply to PACTOR. Don't know if it will work for the
other modes.

See if you have a MYPTCALL you can set in your TNC. Let me know.

I got my circuit to work, the radio keys up when I access the com port from dos. I tried using AGW drivers, they load it seems, and recognize the com port and soundcard, I tried AGWTerm and it will produce audio, although nothing like what I have hard packet to sound like, instead of the brap, I get static hiss... and there is no reaction from the status indicator lights on my taskbar.
I attempted to locate the PC/Flexnet stuff, but it seems that they fell off the wagon, all I get are HTTP404 errors or DNS errors. Now I am stuck, tried several searches on Infoseek and Yahoo... no good...
Thanks in advance

Hamish Moffatt <hamish@rising.com.au> wrote:
>Yet these digital modes are where real HF experimentation is taking
>place, not the phone segment.

Then maybe the phone segment should be reduced :-)

I think it is a little premature to suggest changing band plans at this time since the effects of the recent R+O won't be known for some time. The R+O doesn't even take effect for 3 1/2 more months. Who knows, maybe some of those that get increased HF privileges will find there are advantages to CW and we will end up with more CW ops. Unintended consequences and all that....

Besides, while the new HF modes are interesting, how much real experimentation is involved by downloading someone else's software, loading it onto your computer and running it? When I buy a new scanner for a computer and load the software, I don't call it experimentation. If it seems too much like experimentation, then I take the stuff back!

Hams can give many many reasons why they are involved with the hobby. Boiling it all down to trying to keep up with the latest available in the multi-billion $ communications industry is a mistake, IMO. As a means for self-education, it's excellent. Allowing room for and encouraging "experimentation" is part of what needs to be taken into account when designing a license structure and band plans, but only part of it.

>there are so many great ones out there?

This seems more like a philisophical question. Why would you do anything
yourself when you can just take advantage of what others did?

Well, some people find it satisfying to design and/or construct something
by themselves for a hobby, while others apparently find it good enough
to rely on the work that others have done.

Of course, once everybody has moved to that group, there will be no more
new developments. There already has been a big shift of people from the
"doers" to the "users" group in amateur radio in the past decade or two,
but it seems there still are enough "doers" left to keep the others, that
just install a new program or buy a new gizmo when it "becomes available",
satisfied.

However, it never hurts to encourage people to try to create something
themselves. It will at least give them an idea what is involved before
a program appears on a website as if by magic, and it could always happen
they get the feel of it and join the group of developers.

And you expect that all protocols works well in all environment when
installed?

A protocol may require experimentation in order to get it working in
some particular propagation environments. While CW has a mediocre
performance in all propagation environments, some more modern
protocols work excellently in some environments (e.g. PSK31 in
keyboard to keyboard QSO with a phase stable propagation path), while
the performance drops very badly in a different environment (e.g. file
transfer or in aurora propagation). Thus, part of the experimentation
is selecting the right kind of protocol for a particular kind of
requirements.

By doing so, this is similar to selecting the best tool (e.g. knife,
screwdriver, scissors, sledge) can be used for a particular task and
not having to rely on mediocre tools (e.g. hammer) for all jobs.

If there are any decent online references I wouldnt' mind knowing
about them myself. So you'll have to fall back to books, I'm
afraid. As places to start I generally recommend Ifeachor &
Jervis for DSP, and Haykin for communications (you'll probably
need both). See my web page:

http://www.qsl.net/va3ldh/reading.html
http://www.geocities.com/marsgal42/reading.html

for full citations.

I like Frerking's book for communications applications, but
it seems to be out of print and the only copy I've ever seen
is in the school library...

I just wanted to chime in on the SCS PTC-II and IIe. Amazing units. Frankly, other TNCs are toys compared to the SCS units, at least for pactor. I have used the PK-232 and the KAM+, and the difference even on Pactor-1 is quite noticeable, as neither the PK-232 or the KAM feature true "memory arq." Not trying to gore anyone's ox, but your typical Pactor 1 link with the SCS unit is noticeably better than with, in particular, the Kam+.

Pactor 2 is a fabulous mode, and underappreciated. The links are extremely stable and fast. Additionally, the cool thing about Pactor II is that when you answer a CQ or otherwise link with someone in Pactor I, the link will automatically shift to PactorII if both stations are Pactor-II capable. Thus, when I link with a station, I am often pleasently surprised to see the link suddenly jump into Pactor II. (Very common with DX contacts; the SCS controllers are much more common overseas, both Europe and the Pacific, if my own QSO experiences are any guide). With the coming of the less expensive PTC-IIe, this has become more and more commone with Stateside QSOs as well.

This eliminates one of the main problems with say, GTOR, which is that if two GTOR capable stations link in Pactor-1 (which is typical) the parties will not even know that both stations could switch to GTOR if they wanted to. Furthermore, the only way for them to do so is to kill the link and re-initiate it. For this reason you don't hear a lot of GTOR on the bands despite the fact that there are a lot of Kantronics units out there.

My $.02. YMMV.

I didn't mean to imply that there's anything wrong with writing your own software. I've done it myself. But, the original poster was just getting into digital modes and asked what software was available to decode the signals. He was told to go write his own. I think it a bit overkill to expect that someone just getting his feet wet in digital modes has to first go learn to become a software developer (unless of course you have some inside information that he is already an experienced progammer)!

As an asside: A smart programmer would not blindly go off on such a development project. He'd first try out and become familiar with every piece of existing software he could get his hands on and gain some on the air experience so that he would have a good handle on the requirements.

Hi,

I have this old AEA PK232 lying around the shack, taking up bench space. I only keep it around in case I get the urge to make a foray onto the classic digital modes (AMTOR, RTTY, ASCII, etc.). Does anyone know if there is a single piece of software that can replace this venerable 'box'? Ideally, the software would utilize more modern techniques, such as DSP and would support (at a minimum):

- AMTOR
- PACTOR
- PSK31
- RTTY
- ASCII

Also, the ability to analyize a signal and take a 'guess' at its characteristics - a'la the SI-mode of the PK-232 would be nice, but not essential.

Thanks, Darrell
NR3Y.

ps. No, I'm not interested in Logging Programs that do some of these modes, nor in acquiring multiple programs that specialize in one mode or another - just looking for a composite solution.

LogWindows 3.06.50 Shipping
Program available from Ham Dealers, CSS and the web
Muscle Shoals, Alabama. January 5, 2000: Creative Services Software announced today that the first update to LogWindows in 2 years, version 3.06.50, is shipping.

CSS is selling the program through dealers, direct sales and the web. The program retails for $49.95. CSS is offering upgrades to current users of the program for $25.00, as well as a competitive upgrade from other logging programs for $35.00. Once the 32-bit version is release, the upgrade price will in be $40 for the 32-bit version ($55 competitive upgrade) from the 16-bit version, but will remain at $25 for the 16 bit version upgrades. Price for the 32-bit version will be $79.95 with free 1.x upgrades.

"If someone purchases or upgrades to LogWindows 3.06.50 now, they'll not only get all the future 3.x upgrades, but also a FREE upgrade to the 32 bit version of LogWindows when it becomes available. So for $25 investment now, they are saving money in the long run", said Rick Ruhl,. President and owner of Creative Service Software.

LogWindows 3.06.50 is now on the web at http://www.cssincorp.com/logwindows. This version is a combination demo/release version, which will allow everyone to look at the new version of LogWindows. Once you have purchased the product you can enter your call sign, serial number and activation key in the registration screen and use the full capabilities of the program. Installing the demo version will overwrite any current version installed on the system.

Creative Services Software is at http://www.cssincorp.com
Windows, Windows 95, Windows 98 and Windows NT are Registered Trademarks of Microsoft Corporation.

Hello everyone !!

I am writting some code to a uC to send small beacon frames in packet
ax.25, into the RF spectrum.
I am having some problems in getting the code right, because apart
from the manuals from ax25, i have no way to see what an ordinary
Baycom sends trough the serial port.
Anyone has ideas? thanks

Based on how my TM-733A and all dual (or more) band radios work, NO. THat is
not possible. You'll be able to use one band for RX & TX, but the other band
will be limited to RX only. The ability to transmit is limited to one band at
a time, and there's no way for a tnc to tell the radio to switch bands for TX.

You seem to be assuming that the people that developed the new protocols
and wrote the implementations of them are somehow not hams.

Where do you think the new modes and software came from?

Unfortunately most of the Pactor II tfc you encounter on the bands is
automatic S&F between BBSs.
What about the idea of establishing a calling frequency for Pactor
live QSOs per band? Of course it would have to be an "odd" QRG (xxx.5
mark) to avoid being interrupted by S&F tfc suddenly starting and not
caring about any weak-signal QSO going on.

MULTIMODE 3.0
<A HREF="http://www.blackcatsystems.com/software/multimode.html">MultiMode</A>
A decoding program for amateur radio operators and radio hobbyists.

MultiMode is a shareware application which allows your Macintosh to decode
and transmit several different modes of non-voice communication often heard
on shortwave and ham radio.

MultiMode allows you to decode and display morse code, RTTY, FAX, SSTV,
ACARS, and many other modes on your Mac, without any extra hardware.
MultiMode now also allows you to transmit in most of the modes of operation.

In the past, dedicated hardware, often costing hundreds or thousands of
dollars, was necessary to demodulate and decode this transmissions. Today,
you can use the processing power of your Macintosh to decode and display
these modes, without any hardware. Just connect your radio's speaker output
to your Mac's microphone input, and you're ready to go.

MultiMode supports the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
SSTV (Slow Scan TV)
WEATHER / SATELLITE FAX
ACARS (Aircraft Communications)
PSK31
DTMF, CCIR, EIA Tone Modes
Hellschreiber
Audio Spectrum Display / FFT Mode

MultiMode is shareware. MultiMode may be downloaded from the following URL:
http://www.blackcatsystems.com/software/multimode.html

Hey, I'm for having a calling frequency ..

In fact, for amtor years ago, the standard calling frequencies
were 7075, 14075, 21075, 28075 ... but I dunno, things may
have changed a lot since the early 1980's ..

As for 80 meters, was it 3645 KHz ??

When on pactor/gtor I usually try calling cq's on the freq's
listed above as they "used to be" the standard calling channel.

Anyone know if this is still true??

Trish

A small point - I did *not* tell him to write his own. I merely
suggested it as an option to blindly downloading, which is all
everybody ever seems to do. Look at how many postings in the
newsgroups ask for softwrae. And how many offer software for
download.

> I think it a bit
> overkill to expect that someone just getting his feet wet in digital

At one time people actually *did* need to be highly skilled
in radio hardware just to get on the air. In many ways amateur
digital communications in 2000 are about where amateur analog
communications were in 1930. Why should software be different?

> As an asside: A smart programmer would not blindly go off on such a

> requirements.

Depends on the state of the art. Some of the available sound
card software is excellent. Some of it is adequate. Some of
it is terrible and a smart programmer, regardless of gender,
would want to write someting better.

Well, listening using simple things, like a TX/RX scanner for cordless works fine, as well as listening to cell phones, but the simple fact is a cordless phone just uses a clean frequency. and a cell phone uses a PL tone as well as a frequency, and the tone with some other FM things can hide most analog data. That is what is normally used, and how cops catch these people is just using a 900MHz FM receiver that ignors the PL tones incorporated. Acutally it is pretty easy to adapt a 450MHz receiver to do the same thing, and eavesdrop on those same conversations.
Ham radio experts tend to know the most, and the transmitters normally operate on less than 250 MW, rather than a high output like most commercial radio.

>Well, tell us about it!!!

This is the first mobile I've seen where the faceplate panel _cannot_ be attached to the main unit. Therefore it comes with the remote mount cable and brackets.

(This takes a little getting used to. All my mobiles are on Gamber Johnson Super Slide mounts. However I'm already seeing good reasons to have the panel in view and handy. More later)

Oh, and Kewood points out in a separate carton insert that there are no spare panels. Lose it, have it stolen, break it, or just want one for a different vehicle and you are screwed, at least until some computer software comes out.

This is a dual band 200 channel radio, and can do the standard 2m/440, also 2m/2m, and I think 440/440. There is an integral 1200/9600 TNC, which can be used split between bands for PACSAT work.

The "front" of the tranceiver where the panel normaly goes is covered with 6 (!) jacks, a DB9 serial, a submini phone jack for the GPS (uses the same cable as the D7A), a round miniDIN for an external TNC or VC-C1 (for SSTV), 4 pin mod jack for the panel cable, and 8 pin mod jack for the mike.

This is the first mobile I've seen with an internal antenna duplexer, so there is only one UHF antenna jack on the back, along wiht the power leads, and programmable speaker jacks. Haven't explored these yet.

The front panel is a reversible yellow backlit LCD graphical display. There are two sets of concentric knobs for band volume and squelch, and a rotary encoder for channel, freq, character entry etc, and 10 soft (programmable) function buttons plus the power button.

If you've seena D7A, this radio works a lot like it. Without consulting the manual, I worked through the menus and was on APRS in maybe 15 minutes. There are station list screens, station detail screens, message screens, and so on. You can run APRS from it easily.

The panel snaps onto a mounting bracket, which then can screw to a second bracket to mount on the dash. This has a flange shaped like a peacock tail, and has adhesive on it so you can shape it and stick it right to a curved surface. (poor description, sorry) I haven't used this yet, I just stuck the panel bracket to the dash with velcro.

Leave a lot of slack in the panel cable. It's handy to unsnap it and hold it in your hands like a game controller to programming and messaging.

The other thing this radio will do is digipeat. Except for the price, you could buy one of these, program it with the mike and panel, and have a working digi in no time.

I'm still learning about it. Haven't tried plugging in a computer yet, and the programming software is not yet available.

Post questions and I'll try to answer them.

First, I'd like to state that eavesdropping on cellphones is illegal.
(And I believe that applies to cordless phones as well.)
It's also IMHO immoral to eavesdrop on conversations which
people expect (naively, in technical reality) to be private.

> > I hope you guys can sort out the cordless phones from mobile one.
> > The diffrence is important, a cordless is extremly easy to listen to
> > since most models doesn't use any encryption today.

46/49 phones and early analog 900 MHz cordless phones use FM ...
they would be easy to listen to with a scanner that could tune
the frequencies (though illegal and also immoral, IMHO).

However, the newer digital and spread spectrum phones would
require a great deal of technical sophistication to eavesdrop upon.

For example the FHSS cordless phone chipset which I was
intimately involved in designing for my employer uses digital
transmission, digital encryption, and frequency hopping.
While it's not what the NSA would consider "cryptographically
secure" it's pretty damned private.

>> The phones rely
> > mostly on low-effect transmitters for security, that is; since the
> > signal is hard to detect far away you can't do much hamn anyway.

Phones based on the chipset I briefly described above have
a range of 4000 feet ... the better part of a mile ... in open
field conditions. Buildings and other obstacles, will, of course
reduce the range in an environmentally-dependent manner.

> > If you already are being suspect to an investigation of some sort,
> > then you have a problem. Usually the only thing one has to do; is
> > getting a similar cordless phone and listen through it's handset
> > or in some cases a scanner and a spec on the phone (for the tx/rx
> > freqs).

Even for the analog phones, you will generally hear only one side
of the conversation, since they operate full-duplex on different
frequencies at the same time.

The digital (and particularly the SS) phones are, as I said,
damned private ... I would guess that it would take a minimum
of many 10's of thousands of dollar's worth of equipment and
a LOT of technical know-how to sucessfully eavesdrop them.
(Even having another unit of the same model won't really work
since the handset and base securely exchange security codes
upon which the encryption and the frequency hopping sequences
are based.)

In order to avoid live QSOs aborted by S&F tfc, I think we must stay on
the de-facto 0.5kHz grid. If not, we have potential QRM from both sides.
Over the weekend, I will query my updated BBS database to find out which
QRGs have a minimum of BBSs scanning them. Of course we also have to
avoid the ever-widening PSK31 segment.
Will publish my proposal here soon.

An interesting comment. I mean no offense when I say that it appears
to be an ever-widening TOR segment to my ears! I routinely hear stations
from 14.072 or so right down to 14.060, right on top of QRP CW stations,
QRP PSK31 stations, etc.

135. Tcl/Tk Amateur APRS program for Linux/Windows/Mac/etc

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-07 00:00:00 UTC
From: Jeff Pierce <piercej@preferred.com>
Message-ID: <3876115E.F44AFF1A@preferred.com>
Source record: 14870
Cross-posted to: comp.lang.tcl,rec.radio.amateur.misc,rec.radio.amateur.digital.misc

I have developed a Tcl/Tk application for the Amateur Radio APRS system.
It was intentionaly written to run under Linux/Windows and other OS's
running Tcl/Tk with no code changes other then specifing the serial port
of the TNC. I only have the resources to test under Linux and Windows.
The main feature is that it uses the US Census Bureau's on-line Tiger
mapping service. This great service allows users to get US maps from
them using just the http protocol, and not have to use a web browser.
It is not a full blown app at this time in the state of
winAPRS/javaAPRS. It was written over Christmas/New Years holidays just
to fill in cold nights.
What it does do is to provide a source code base for future expansion
and customization.
Features:
Uses Tiger on-line mapping service.
Map can be zoomed in and out with mouse.
Map can be re-centered using the mouse.
Latitude and Longitude of a point can be read using the mouse.
Decodes a subset of the APRS format and displays the station and
callsign on the map.

And, since it is Tcl/Tk scripting language, ya get the source. I'm
releasing it under the GPL license.

regarding digital spread sprectrum, it is a different technology probably based off an alogoritm and a base, old cell phones are not digital, and cannot be listened to and anything that is digital spread sprectrum needs a decoder, probably programed as a cmos with the alogorithm and a computer to analyze the signal, but because of the encryption possibilities, decoding is particularly annoying and not to be done..... the source code for that digital first needs to be analyzed and cracked on a controled signal.

oh, and another thing, i cant spel....

otherwise, don't bother too much work to get it down, check out a patent office for details on spread sprectrum technology.

139. Re: Multi-Mode TNC Emulation in Software?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-07 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <6Zsd4.202497$5r2.544973@tor-nn1.netcom.ca>
Source record: 14874

Hi Darrell,

I am not quite sure what you are asking. If you want another BOX that will do everything. There is no such beast.

The best all mode modem available is the SCS PTC II or SCS PTC IIe. The SCS PTC II is a DSP modem that supports RTTY, AMTOR, PACTOR 1 and PACTOR II, PSK31, NAVTEX, SSTV, FAX, HF packet etc. The SCS PTC II and the SCS PTC IIe are the ONLY modems which support PACTOR II, a proprietary mode of SCS. In my view, PACTOR II is by far the most robust HF mode out there! It is great. DATA just zips along even if you can't hear the signal. Unfortunately, the SCS modems are expensive.

In addition, the SCS PTC II or PTC IIe do not support GTOR or CLOVER which are other proprietary modes of KANTRONICS and HAL. Not a big loss in my view. There is very little GTOR activity on the ham bands. There is more CLOVER activity. But PACTOR II is by far the most popular of the proprietary modes.

BUT I suspect you are looking for software to be used with a PC or MAC (with a sound card) which would allow you to transmit and receive AMTOR, PACTOR, PSK31, RTTY, ASCII etc. I also suspect that you are looking for FREEWARE or relatively inexpensive software. (Why else would you choose a sound card over a dedicated external DSP based modem??)

There are many PC based programs for PSK31, RTTY and ASCII, and AMTOR. Most run under windows but some run under DOS.

Unfortunately, there isn't one program for a PC that does all the modes you mentioned.

For PSK31 and RTTY, you may want to consider WRITELOG for Windows and a sound card. For PSK31, Use Logger for Windows and a sound card. Logger is great! (Logger is freeware and can be found at www.itis.net/golist).

The hardest modes to implement using a WINDOWS based program are modes that have strict timing requirements like AMTOR and PACTOR. I don't know of ANY WINDOWS based programs that implement AMTOR and PACTOR protocols in the PC. Some have tried using a Windows based program but gave up due to timing problems (i.e. the link was very unstable!)

But using DOS is a different story. It is a lot easier (but still hard) to write programs for DOS that have strict timing requirements (eg AMTOR and PACTOR)

HB9JNX has written a freeware program for DOS called TERM PSA that implements RTTY, AMTOR and PACTOR 1 protocols in the PC BUT the PC needs a

really good sound card with its own DSP chips. The TERM PSA program runs only under DOS and only supports Soundcards with a PersonalSoundArchitecture (PSA) Chipset from Analog Devices, such as Echospeech Personal Sound System and others. TERMPSA.ZIP can be found at http://www.ife.ee.ethz.ch/~sailer/ham/ham.html. TERM PSA will NOT work with the typical sound card found in many PC's (eg Sound BLASTER)

Alternatively, using a very simple external modem that decodes and generates MARK/SPACE signals, you can run RTTY, AMTOR and PACTOR I with another DOS program called TERMAN93 by HB9JNX (go to http://www.ife.ee.ethz.ch/~sailer/ham/ham.html)

TERMAN93 (and TERM PSA) implement the RTTY, AMTOR and PACTOR protocols in the PC. Since DOS is used as the OS, it is possible avoid the timing problems inherent with using Windows.

Another DOS program called PCTOR ver 3.08 by KC7WW also implements RTTY and AMTOR protocols in the PC and uses a simple external modem that decodes and generates mark/space signals.

Examples of simple external modems are old AEA CP-1, the newer AN93 DSP modem (see TAPR for kit) or new Volks RTTY II modem. None are very expensive.

For TERMAN93, the AN93 modem is the best since it has a DSP chip for hardware memory ARQ.

Another approach is to use HAMCOMM 3.1 software and a simple HAMCOMM interface (which costs about $15 US to build). Hamcomm 3.1 only implements RTTY and AMTOR protocols in the PC. (But with the registered version you can receive only PACTOR 1).

To summarize, Windows is a very poor OS for implementing in the PC timing sensitive protocols like AMTOR and PACTOR. DOS is much better. (Don't be fooled -- you typically can't run these DOS programs under a Windows DOS box!)

There is another choice for an Operating System (OS) - LINUX. There are programs out there that implement in a PC running LINUX the RTTY, AMTOR, PSK31, SSTV, PACTOR and Packet protocols. All you need is a PC with a sound card and the LINUX OS (and the software for these modes). I don't know much about LINUX but apparently it is not as bad as Windows for implementing "timing sensitive modes" like AMTOR and PACTOR.

Using the LINUX OS on a PC appears to be the best choice at this time for a HAM that wishes to use his computer's sound card for RTTY, AMTOR, PACTOR, PSK31, SSTV and Packet! Unfortunately, one must typically run separate programs for each mode!

Going back to windows, IZ8BLY has written a great Windows program that uses your sound card for the HELL fuzzy modes. (See JAN 2000 QST). The program is easy to use and is free! Give it a try!

For the MAC and a sound card, there is multimode as mentioned in another reply to your posting. It is really the only choice out there for a MAC user.

I understand that MULTIMODE for WINDOWS is being developed. I can't wait to try it out. But I suspect that it may not work well on the modes with strict timing requirements like AMTOR and PACTOR. It is possible that MULTIMODE for Windows may only PERMIT the reception of AMTOR and PACTOR but NOT the transmission of AMTOR and PACTOR. Don't fault the software developers, it is WINDOWS which is to blame!

In any event, It appears very unlikely that there will be ONE program for either the MAC or PC that will allow one to receive and transmit ALL the proprietary modes, like PACTOR II, GTOR, and CLOVER, using a sound card. At this time, HAL, KANTRONICS and SCS do not appear very willing to licence the use by others of their proprietary HF modes!

What frequency are these unattended stations on? I want to avoid them
at all costs. I can guarantee that almost all of my PSK31 QSOs on 20m
are interfered with by PACTOR signals at some time. If PACTOR is a good
weak signal mode, it surprises me that so many stations run such high power.

Fortunately, if I were to try PACTOR at home I would promptly
destroy the relays in my rig I think. This is the final nail in its
coffin for me.

Hamish, it might interest you to know that PACTOR II will work at a
lower S/N ratio than PSK31. That means PACTOR II is a better low
power mode than PSK31.

Is this correct? I thought it was illegal to manufacture, sell or modify equipment that picks up cellphones. I didn't think they actually banned listening. Of course repeating what you hear is another matter...

You are correct for the TM-732 and TM-733, however, the TM-V7A has a separate data port for attaching a TNC. As I read the manual, the data port can transmit on one band while (maybe not simultaniously) the other band is used with the standard microphone. My thoughts are to use the data port for 9600 on 70 cm and the regular microphone connection for 1200 on 2 meters.

My question was first rather anyone has already done something like this so I don't "reinvent the wheel" and second if anyone may have actually looked at the feasability of such an arraingment and had any comments or insights as to the best way to aproach the project. Also, has anyone had enough experience with the KPC-9612 to know if it attempts to transmit simultaniously on both ports.

148. HF Packet /Pactor stations in Texas ???

Any packet /pactor operators in Texas? I would guess there are!
My brother finally set up home in Belmont, Houston. I want to set up
an HF route to him from uk. Can someone point me to some frequencies
and callsigns so I can monitor the path. Alternatiely a useful node
that has good routes to Texas and across the atlantic.
Thaks
Richard G4BBH.

Of course, a more reasonable coder would use "tm_year % 100" and not have
that problem.

Well, that's what I said: "No commercial equipment available today is able
to
intercept DECT, but with the right amount of time and money, anything is
possible."

meaning, You can't go out and ask for a DECT-capable
scanner/decoder/whatever.

From what I know, there is not so much interest in DECT from the agencys
because of the way it works. A DECT phone is pretty much always conected to
a land line. Land lines are easily monitored through normal channels.

GSM is much more an issue, especially since the introduction of pre-payed
ANONYMOUS subscriptions.

Why would the situation be different then? Even on GSM, authorities should
be able to eavesdrop without having to listen to radio traffic. Operators
are required to provide the possibility of a tap (at least here they are).

Anonymous subscriptions are another issue, indeed. Of course the operator
always knows where you are and where you have been, but it is probably
tricky to find the subscription ID of a certain suspect person using that
method, given today's user density.

Probably in the USA. Over here an all-band receiver just includes the
cellphone frequencies, and anybody can listen to them. But the analog FM
system has been quickly phased out and now there is only GSM which is more
difficult to listen to.

Yes, it's true ... Congress (in its "infinite wisdom" legislated privacy of
over-the-air, in-the-clear cellular transmissions several years ago, and
recently reaffirmed and strengthened that legislation).

Yes, it's stupid. Yes, it's compeletly ineffective against anyone who
really, really wants to listen anyway. Yes, rules mandating that
cellphones contain proper encryption circuitry to REALLY meet
the public's expectations that their calls are/will be private would
have bee the sensible choice.

But then, we're talking about the GOVERNMENT here, so what
do you expect? :-)

Hamish,

The PSK31 people should move to the non-burst
mode / RTTY segment, where they belong to.
I never understood why Peter Martinez (G3PLX)
proposed 14070 kHz as PSK31 calling frequency
since this frequency is located right in the

center of the burst mode band segment. Thus,
collisions are unavoidable!

The other nail in its coffin (for me) is that it's proprietary.
Definately lack of interest as a result.

159. Balloon escaped

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-08 00:00:00 UTC
From: rdavis@nyx10.nyx.net
Message-ID: <947355636.379495@iris.nyx.net>
Source record: 14890

12:19 PM Central USA time.

An amateur radio balloon launched this morning from near
Salina Kansas did not burst as expected.

When last heard, the balloon was over eastern Missouri
traveling east very rapidly. The onboard telemetry
is sending GPS data on 144.34 mhz, 1200 bps AX-25
packet. The batteries will probably not last much
beyond 1:30PM CST.

The balloon seems to be hanging at about 117-thousand
feet. It should have burst and descended two to
three hours after launch at 7:51AM CST.
Any captured data would be greatly appreciated

160. Using Packet connector for normal audio on Yaesu VHF mobiles

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-08 00:00:00 UTC
From: Dick Grady <grady@wizard.com>
Message-ID: <220f7ss5nqi975qvr0al1jsm10dc4e5btg@4ax.com>
Source record: 14891
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.equipment

A group of us no-code Techs want to send code practice as MCW (bursts of tone representing the dits and dahs) over a 2-meter FM simplex channel. To generate this signal, I decided to try to connect my computer's headphone jack to the packet interface jack on my Yaesu FT-8100 mobile. One pin when grounded keys the transmitter; this is more convenient than pushing the PTT switch for many minutes. Another pin is the data input, which I assume is analog audio, because on my handheld radio the packet data is fed to the auxiliary microphone input. [I prefer not to use my handheld for this, as I intend to transmit for about 10 minutes at a time, which I considered 100% duty cycle, and I doubt that the handheld can stand that. The 50-watt mobile will be operating at 5 watts, and should be able to handle the 100% duty cycle OK.]

Unfortunately, it doesn't work. I'm monitoring the transmission on my handheld. I can key the carrier OK by grounding the keying pin. But I can't transmit any recognizable audio. When I increase the audio drive I hear no modulation on the carrier until eventually the carrier becomes intermittent at 1/2 second on, 1/2 second off.

What am I doing wrong? Is the Yaesu doing some kind of signal processing on the packet data input, such as threshold detection? Is this data input actually digital?

----- Snip -----

Hi all, again

Realised that I should have stated mode and equipment.

Mode VHF Packet

Equipment MFJ 1270C 1200Bd TNC

Same day response was fantastic

Have changed settings, corrected the placing of the '/' & W6 and am ready to go

The MYPTCALL unfortunatley appears not to be available on the MFJ1270C, hopefully will be on the next version of firmware

Thanks again

Phil W6/ZL1TSC
Email hotcowgirl@snowcrest.net

----- End Snip -----

Wait a minute!!!!

I am using a PK232MBX with Lan-link software. Also, have MFJ1274B. I can't make that work. It says in the book that you are only allowed 8 characters. W6/ZL1TSC is 9 characters.

I just tried it with the W6 in front and behind. Neither one worked for me. What am I doing wrong?

Jack VE3EED/W7
Phoenix,AZ

P.S. Maybe it won't work because I'm in Arizona. hi hi

Message-ID: <lcNd4.7959$7L.412008@tw11.nn.bcandid.com>
Source record: 14896

Jack,

Alot of people are seeing the date in many programs as xx-xx-10. Here's the reason.

Most non Y2K compliant date functions for the two digit date use the 'years since 1900' calculation. Both PcPakRatt and pre 3.05 versions of LogWindows used this. So what you are seeing is 100 years since 1900, with the trailing 0 truncated.

The only fix for these problems, is for the coder to go into the source code and do the following:

```
if (date >= 100)
date -=100;
```

That sets the date to : Years since 1900 minus 100 if it's been 100 years or more since 1900.

And no, it's not 'Y2.1K' compatible. ;)

Hi guys, just started up a PK-232 with Pacterm to check it
operationally. Seems to function OK.

What software/freeware is available to run fax/sstv and other hf modes
for rx monitoring only?

Nick,

I hope you mean PKTerm. <g>. Pacterm is for Kantronics.

You probably know we have Wefax '99 for the PK-232. The PK-232 only
supports 2 color mode in Wefax. If you haven't seen Wefax '99, it's at

Dick, your arrangement sounds OK. What pin (name) did you connect to
for transmit audio? Maybe you are not connected to the correct pin.
What software are you using on the computer to generate the audio?

You should use the 1200 AFSK input on the Yaesu, and not the 9600 FSK
input, if they are separate. You might have to tell the Yaesu to use 1200
mode in the menus too.

However, selection of which band controls "PTT" is usually limited to one band
at a time.

So it would seem! We've discussed this on the PSK mailing list
and we seem to agree that that the RTTY segment should be fine
(especially since it seems to be deserted lately), but then nobody
moves.

Thanks for your input.

Does PSK31 actually interfere with your PACTOR signals? I know that

No not really. But I don't want to use a freq that is clearly
occupied. Sometimes PSK can interfere with pactor, but the real risk
is in the other direction. Some of the PSK guys I know have gotten
pretty belligerent to anyone using Pactor below about 14.072. One guy
told me that he tries to position his PSK signal between the mark and
space of Pactor signals there. I of course pointed out to him that
this is illegal interference and bad practice, but oh well.

Roger J. Buffington
W6VZV; w6vzv@arrl.net

So this guy walks into a bar and says to the bartender "All lawyers
are assholes."

And a guy at the end of the bar says "Hey, I heard that. I resent

>equipment that picks up cellphones. I didn't think they actually banned
>listening. Of course repeating what you hear is another matter...

Yes. The Electronic Communications Privacy Act made the actual act of
eavesdropping on cellular calls a crime. Before that Act, the Communications
Act of 1934 ruled. It merely forbade disclosing anything you might have heard
on any non-broadcast radio service to a third party (or from profiting in any
other way by any information you obtained by such eavesdropping).

The ECPA covers a wide range of radio services, not just cellular. In short form,
if it isn't intended for the general public to hear, it is a crime for you to attempt to
listen to it unless you are authorized by the sender to do so. The broadcast services
are an obvious exception since they are intended to be heard by the general public.
Amateur radio was also exempted by name, as are the non-encrypted transmissions
of public safety agencies. (The latter was a bone thrown to the police call scanner
enthusiasts. The original draft act banned this too.)

HAL has expressed a willingness to cross license Clover II to other makers.
But the other players don't seem willing to do so, at least not on reasonable
terms. It would be a good thing if all the manufacturers could get together
on this, but it doesn't look like it will happen. Their proprietary nature makes
these protocols less attractive than they otherwise might be.

> Pratically it is a double edge detector, any ideas?

Use an exclusive-or 2-input gate with an R-C delay on
one of the lines. Signal goes to one input and one
end of the resistor. Other end of the resistor goes
to the other input which has a cap to ground. The
delay will cause a difference in the input signals
at each edge. The RC time constant controls the
width of the output pulses.

Message-ID: <387AB417.9B28E219@nospaminame.com>
Source record: 14676

Hello,
I need to build a digital edge detector that give a "1" spike on every level change of the incoming signal.
Frequencies are in the range of 300 to 9600 Hz (with a future maximum of about 500KHz).
Pratically it is a double edge detector, any ideas?
I could buid using a couple of 555 and some logic but I was wondering if there is a smarter design...
TIA,
Giuseppe Marullo

I don't think the source code is available, even if you were a coder.
I haven't seen anything from the author is several years either.

There is a Y2K update for paKet. It is similar to Lan-Link, but with
slightly different features. You can get this at
ftp://tapr.org/software_lib/terminal/paKet62.zip.

192. Routing in Packet Radio Networks

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-11 00:00:00 UTC
From: tenali <tenali@bellaltlantic.net>
Message-ID: <oQze4.3788$I5.381796@typhoon1.gnilink.net>
Source record: 14678

Hi!!

Can anyone explain to what extent amateur and commerical packet radio
devices are able to perform multi-hop packet relay using routing protocols
like
RIP, OSPF, etc.? Or is multi-hop packet radio communications
limited to research (DARPA) and military packet radio networks?

I understand that there are digi-repeaters, but that these merely
relay and broadcast signals, so they do not perform routing.
Do packet BBS systems automatically route among each other
or do they require manual routing configuration by the operator?

Thanks.

-Sri

193. APRS sid's

Ok...Im pretty confused about the SIDs being used in APRS. I run a very high profile node here in Ohio, and everybody keeps giving me advise about my alias(s), my unproto paths, and my SIDs.

I would like information/opinions on how the structure *should* be. Here is what Im running;

My only alias is "wide" (no "relay")

My unproto path is "wide,wide"

My SID is "-4"

The SIDs are my main issue...I have people telling me to run -2, -4, -7, -10, -14, -15, ect. I also see all these other being used...is there a standard, or not?

Thanks much, & 73.

Message-ID: <387b3120$0$1397@news.voyager.net>
Source record: 14680

Can anyone recommend a good reference for implementing modems DSP? I am a computer programmer and have a good understanding of algebra and took calculus in college, but would prefer a discussion that doesn't require a lot of higher mathematics. I've read the DSP theory section in the ARRL Handbook and its a good start, but doesn't give a lot of specifics. I'm not looking for a specific DSP chip, although I just purchased a JPS NIR12 and SDK12 which is based on the TI TMS320C2X. I've downloaded some of the manuals for this chip from the TI web site.

I'm particularly interested in implementing modems for modes like SSTV, PSK31, RTTY, etc. I already have software that does it, but I'd like to try 'rolling my own'. I think that DSP programming of new modes may be the hombrewing of the 21st century.

Hi Paul,

The Palm OS already has an APRS program written for it. The program has been out for a while & has seen multiple version updates already. As far as Windows CE, the world is still waiting for APRS for that system. It supposed to be out very soon though. The best place to check for anything APRS or packet related is:
http://www.tapr.org

I have a factory refurbished Casio Casiopiea that runs Windows CE and I would love to run APRS on it. Right now only one company makes a CE specific packet program. That is:
http://www.cssincorp.com/
It's worth just checking out.

Take care & good luck OM.

Hi Chris. The *only* situation where you should use a non-zero SSID in your callsign is where your station has no other means of specifying a symbol. This usually applies to standalone trackers.

If you can specify the symbol in the destination address (e.g. UNPROTO GPSLN via WIDE, WIDE specifies a node), or in the beacon text (e.g. BT 1234.56N/01234.56Wn ....) then you do *not* use a non-zero SSID in your MYCALL.

>is

: --

He'll also need a good Digital Comm Reference...

A good starting place is...

Digital Communications by Proakis (Perhaps a bit math heavy)

AND an excellent companion...

Contemporary Communication Systems Using MATLAB by Proakis and Salehi

Along with that recommendation, the Student version of MATLAB is an
excellent place to play with DSP related stuff... If you can't get
hold of it (either for cost reasons or student status reasons), Octave
is an excellent substitute!

If Proakis contains daunting math... A secondary suggestion, and an
excellent text as well, is...

Digital Communications: Fundamentals and Applications by Bernard Sklar
(A wonderful lecturer and all around neat guy... This book probably is
the best choice for a good overview...)

I'd hang off on the DSP specific texts (NOTE: Im not contradicting the
previous poster's recommendations)... Both Sklar and Proakis go into
detail on the specific implementations of DSP related "things" that you'll
need to know... (Basic filter design... Demod implementation...)

Either way, I'd pick up the MATLAB book... Most of the examples can be
easily ported to C if that's your environment of choice, and they do a
pretty reasonable job of covering most of the topic you'd need to know
something about...

Good Luck! Feel free to email me if you've got any additional concerns/
questions!

Best Regards,

That's a must have, but I'd also recommend
Digital Modulation and Coding by Stephen Wilson.
That'll give you a broad understanding of *why* you
want to code certain ways and not others. It can save
you chasing down a lot of dead ends.

> Thanks much, & 73.

The "use/assignment" of SSID's to particular functions is a local issue.

However, here in Southern California, we have some "standards:"
-3(2m) & -5(70cm) usually represent TCP/IP interlinks
-15 is avoided since Net/ROM's use it for callouts from direct keyboard
sessions (i.e. "-0" connect-in's)
-1 sometimes represents a private (e.g. in TNC) maildrop.
- The LA Sheriff's DCS uses -10 and -11 to indicate Net/ROM ports.
- Net/ROM nodes (other than LASO DCS) use lower SSID's (-1 through -7)

APRS here usually uses SSID's above 7 (i.e. -8 through -13).

I hope that our uses helps you in deciding.

> My only alias is "wide" (no "relay")
>
> My unproto path is "wide,wide"

Can you tell us what brand/model of TNC you
are using? There may be a much better spot for
WIDE than in the alias.

Can you also tell us how far it is to the
next wide digi and if your station can
reach more than one wide digi?

--

There is rarely a fixed aprs station
that should be using the upath WIDE,WIDE.
Those two wides are likely to hit another
wide digi and both will get digi'd back
to you where they will duplicate themselves
and cause a lot of excess dupe packets.

If it's a KPC or PICO TNC we can set it up
so that the digi will not digi any packets
that it has previously digi'd itself.

Email me if you like and/or post to the NG.

Lumpy ab0gd suggests:

Specifying the icon by means other than the SSID is the
preferred method

-BUT-

If you operate more than one station (an APRS digi
and anything else, mobile, HT etc) the FCC rules
want you to ID one of the stations with some form
of unique identifier.

That was one of the original reasons for the SSID.

If you want really narrow edge detect pulses, use gate delays
instead of the R-C delay Cecil suggests.

Most (all other) Kenwood radios don't operate that way.

As for keeping the KPC-9612 from attempting to key up BOTH transmitters simultaneously (if that causes a problem), try the "ONERADIO ON" setting.

Good gosh - this is the first reference I've seen to S100 in 15 years!
Is there really S100 kit still in use? I gave all mine away when I
got my first IBM pc (I did keep mu tape drive to use on the pc).

Same here. I gave away my Northstar Horizon almost 20 years ago. Only kept one board stuffed with a gigantic 64K of RAM as a curio.<g>

I'm building a 45' cutter in strip/composite. Watch my progress (or lack there of) at: http://www.mindspring.com/~gashmore

213. PK900 Slow RTTY print

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-12 00:00:00 UTC
From: Sharon L Taylor <dstaylor@minn.net>
Message-ID: <387D21B4.E5990F78@minn.net>
Source record: 14504

Interested in hearing from anyone who has experienced a problem with the PK900 not printing the RTTY in realtime when the 2nd port is connected to VHF packet cluster. When there is a lot of activity on the DX cluster, the print for the RTTY lags significantly behind the real time signal. This is lag can be as long as minutes in some cases. If I only use the RTTY port and shutoff the Packet port, the print is as you would expect, character for character as it is received.

Appreciate hearing from anyone who may have experience similar or other observations with the PK900.

214. Power Connectors

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-12 00:00:00 UTC
From: Ken Mirabella <kjm@flo-bin.com>
Message-ID: <zqaf4.144$ze4.20592@typhoon-la.pbi.net>
Source record: 14505

Subject: OEM "T" power connectors and Anderson Powerpoles

I have started a new web site to sell the hard to find and "elusive"
Anderson Powerpole connectors that have become (or are becoming) the most
popular power connector for interchangeability in the emergency community
along with Yaesu, Kenwood and Icom mobile OEM "T" power connectors.

www.powerwerx.com was started with hearing the concerns of hams across
the country in newsgroups of "where to purchase these connectors" and other
"hard to find" products at reasonable prices.

PowerWerx.com encourages groups to pool their purchases to obtain a very low
price on power connectors.

I apologize for the commercial promotion, but I feel that an on-line secure
source for these products has not been available for quite some time.

We accept MasterCard/Visa.

The philosophy of "one ham helping another" is now extended from my web site
to you.

Ken, KM6YH

Depending on the logic family you're using and its propagation
delay, you may need to cascade several gate delays to get the
desired pulse width ... also, make sure that the combination of
gate delays is NON-inverting ...

From: "L. E. Dietrich" <lou-nn2g@worldnet.att.net>
Message-ID: <85jgo8ipd1@bgtnsc01.worldnet.att.net>
Source record: 14507

The other night I tried to get WF1B's program to work with my PK232MBX....

My old version 2.1 WF1B for some reason couldn't communicate with it...PCPACRATT was fine....tried HYPERTERM and all was OK....

Got late and went to bed..Next morning, the MBX didn't work with anything!...It seems to go through it's start up routine but I cannot communicate with it....tried removing the JP1 jumper...still NG.

Have another MBX...tried it and all is OK...looks like the first MBX died....

Sending it back to Timewave is $75 for repair...so I would like to replace the I/O chips first...

Anyone have any ideas....on the problem...or where I can get the chips?

Thanks ahead of time!

Lou N2TU

I'm offended and confused. Your right, might right and the next
guy's right are three different things. You are not a nitwit
if you don't agree with 'my way' and I am insulted as a ham
and as an aprs user when you refer to another aprs ham
as a nitwit.

I'm hoping it was just my fault for misunderstanding
your choice of words.

Thanks for your answers.
I don't need the narrow pulses, I already used the gate delay and XOR solution but It does not work well, I can't even detect the incoming frequency doubled at the output.
I think I will go for the RC solution, I need it to sync a pll on a digital biphase signal with 300-9600 speed. Any other interested in a biphase decoder to tx a rs232 data stream (full async with clock recovery)?

However, if you would bother to RTFM, you would find that on the TM-V7A
the data port operates the opposite band as the microphone PTT.

Yes, and you should not give in to the protocol design nitwits that attempt
to put as many useful bits into the address header as they can possibly
think of. The address header is for addressing, not for specification
of symbols or station location or message switch position or... etc.

Boycot misuse of SSID, just put something in there that you like.
Ignore the comments from those that claim "it isn't right", they
should adjust their definition of "right".

By golly, Rob, that's *fighting* talk .... <grin>

In fact, the APRS Protocol Spec says that the SSID in the source address
is intended for standalone devices that have no other way of defining a
symbol, *BUT*, if a symbol code appears elsewhere in the packet, it will
override the SSID symbol code.

So, provided you specify the symbol code in the *destination* address
(e.g. GPSxyz) or in the Information field (e.g. with a posit), then you
can use *any* source address SSID you like -- the receiving end will not
interpret the SSID as a symbol.

What's needed is more intelligence in the TNC. With a bit more code in a,
few places the number of possible APRS data strings could be cut significantly,
ideally to just one format. As it is now, the TNC has no real understanding
of $GPGGA etc, just remembers them and beacons them. The decoding
software is expected to understand normal APRS strings, NMEA-0183, etc, etc.

> So, provided you specify the symbol code in the *destination* address

IMHO APRS badly misuses the destination address also. It is being
used to give software version numbers, even. I refuse to use any
destination other than "APRS", and I don't use WinAPRS either.

I've experienced a similar problem while running WF1B's RTTY contesting program and using my PK900. I find that I can usually make it better by turning the volume on my VHF transceiver down to zero. If all else fails, I simply disconnect the VHF port and reboot the contest software and reboot the PK900 (saving my contest log to disk first, of course).

Red N3TG

P.S. Just installed the new PKTerm99 software and will try that to see how the '900 handles with that under similar configurations.

I have a complete S-100 desktop box.
It has a Z80 processor at 6MHZ and
64K of ram and dual 8 inch floppies.

It worked the last time I plugged it in.
That was about 15 years ago.
I can't remember the brand.
It was not one of the early famous brand names.

Anyone interested?

Since both Pkterm 99 and any other terminal program (PkaRatt,WF1b, Pkgold, XPWin, etc) just parse the characters coming from the TNC and dont do any decoding of the signal, my guess is you'll see the same issues.

I'll get with Randy at Timewave and see if he can talk to the firmware coder about it. Since we're at the mercy of the serial port of the TNC, we need to see why when connected to both ports, you'd see a lag in the TNC.

I also wonder if maybe there was some strange firmware revisions out there? I'll have Bill look at it in house here and see what we can come up with. We have the latest firmware and the DSP upgrade for it too, so it'll be interesting to see what we come up with.

I don't know what part of the APRS protocol you designed, but when
it is the MIC-E protocol I classify you as a nitwit.

When you did not design the protocols you apparently did not understand
my comment.

Thanks. I haven't updated my firmware since it was purchased back in about 1996, so could that perhaps be a problem I haven't considered? Actually, I like the little box the way I got it, and since I don't have exotic uses it has served me well. I never did pop for the DSP upgrade either, figuring that I had gone down that path too often with my PK-232s for very little net satisfaction for my needs. Yes, I know...DSP is supposed to be different and maybe it is, but I have made do without it so long now...

I have seen similar resluts with the PK900 when it is
used in Host mode and HPOLL is enabled. With this
combination the TNC gets very slow.

This condition gets worse when the packet channel
is extremely busy (as in a DX cluster node).

I tested this when I was developing XPDUAL and
XPWIN and decided to run with HPOLL OFF.

You are welcome to connect to a New Internet Accessible PacketCluster
at telnet address: 209.32.226.63

This AR-Cluster is located at KC0DJO in Duluth Minnesota and is part of
the Midwest PacketCluster System.

At your initial sign on you will be asked for your call, name and QTH.
Enter your QTH as 'City State' or 'City Country', e.g. Chicago IL or
Oslo Norway so we can see where all our new friends live.

Enter HELP SET for information on setting or resetting your Location
(Lat/Long), QTH and NAME.

You can send a cluster mail to the sysop with the command 'S KC0DJO'

73 and Welcome

Ron N5IN

Thanks for the info Gary. Pkterm '99 uses HPOLL off too on all the
aea/timeave TNCs, so it looks like your and my programs won't have the
slowdown problem they are running into with the others.

Ham Radio University - HRU2000
Babylon Town Hall Annex
Phelps Lane & Miller Ave
North Babylon, NY
Sunday January 23, 2000
9:00 AM - 2:00 PM

This is a special day of education for amateur radio. Many ham radio Clubs and organizations from the New York City-Long Island Section will have information booths. This is your opportunity to meet the local clubs and organizations and learn their activities, meetings and membership. There will be a free tune-up clinic, DXCC & WAS card checking, eye-ball qso room, a full VE session along fifteen technical forums with guest speakers from the NLI section.

Donation: $2.00. Spouses and children under 12 will be admitted free.

For more information via Internet: http://arrlhudson.org/nli/hru2000.htm

Contact: Phil Lewis N2MUN (631) 226-0698

FORUM SCHEDULE

250. Portland, OR -9600 baud packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-16 00:00:00 UTC
From: Andy <andy@transport.com>
Message-ID: <pndg4.6181$pb2.514266@tw11.nn.bcandid.com>
Source record: 14536

Anyone know of any activity in the Portland/Vancouver metro area on 9600 baud, besides linking between nodes. I have a Kenwood TH-D7A and would like to be able to try it out on 9600. Also I have access to some 9612's and UHF radios and possibly a mountain top to put them on, to be able to fool with 9600 TCP/IP or something similar. Any interest out there or suggestions on what to do?

Is there an aprs program for the HP-49/49 calculators. These
calculators have
serial ports and would make great low cost/low power text terminals.

Tons of activity!

A great deal of that "linking between nodes" is tcp/ip between
individual stations. Put something on air on any frequency you
hear activity, connect to any bbs, send me a message
(w0rli@w0rli.or.usa.noam), and I'll ship you the basic info
about tcp/ip in the Portland/Vancouver/Eugene area.

Nothing on six at this time.

For two meters, you will find activity on (at least):

144.91, 144.92, 144.93, 144.95, 144.97, 144.98, 144.99,
145.01, 145.05, 145.07, 145.09, 145.51, 145.53, 145.57.

There are also many frequencies in use on 220 and 70 cm.

262. New Internet PacketCluster Site

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-17 00:00:00 UTC
From: nfivein@my-deja.com
Message-ID: <85vpfa$mq8$1@nnrp1.deja.com>
Source record: 14548

You are welcome to connect to the New Internet PacketCluster Site at KC0DJO in Duluth Minnesota.

The IP address is 209.32.226.63

At your first check in you will be asked for your Call, Name and QTH. Please enter your QTH in the form: Chicago IL or Oslo Norway so that we will know where all our new friends are from! You will also be reminded to SET/LOCATION, that is optional but recommended. If you properly do set your location, then the cluster will calculate beam headings for you to various prefixes. For HELP on these commands you may type

HELP SET/NAME
HELP SET/QTH
HELP SET/LOCATION

To see what you have entered type: SHOW/STATION -your call-

You can correct any errors using the SET commands.

For more information on PacketCluster including a Logon Tutorial and Command List go to this website:

http://www.cestro.com/pcluster/index.shtml

Ideally you should use your logging program to make your telnet connection. Its a huge advantage as then your logging program will monitor the dx spots and alert you to contacts you need.

However, here are very simple instructions using software already a part of Win95/98:

First connect to your ISP.
Click Start / Click Run
In the box enter: telnet 209.32.226.63
Click OK

You should now be connected to the KC0DJO cluster.

Enter your call. If it did not echo, then you will have to turn on local echo. Click on Terminal / Preferences.. and check Local Echo and then click on OK.

Now proceed as earlier described to sign on.

Try some common commands as:

SH/DX
SH/C
HELP

Welcome and 73 de Ron N5IN

Sent via Deja.com http://www.deja.com/
Before you buy.

Hi members of the lists

Just a note about what I plan for my amateur radio station over the next few months.

Some of you already know I plan to setup a packet BBS but I would like to find out what you a user of packet wouyld like to see given my interests.I plan to make the station as user friendly as possible so give me a few ideas that you as a packet ham can use via packet messages.

I plan to have a system which runs FBB and APRS and perhaps UI-View as well on a Windows 2000 system.I would like to be able to setup mailing lists which users run for packet on my BBS so that all members can automatically subscribe or unsubscribe to or at least get a listing of the available ones.If APRS data can be forwarded I would like to enable users to send the station a message with a certain command in it and then receive the APRS data they asked for.The station will strive to be a gateway to the internet as well so that epople can submit requests via email and receive the results via packet or email or whatever other services are on the BBS system.I can say that the system will be running on Windows 2000 as this is the OS most of the developers have used and therefore there are allot of apps for Windows as opposed to Linux.Considering I also have a serious interest in computer security and hacking I would also like to have a system which has as many of the network tools as possible so that for instance a user in California can do a trace route and find out which packet stations were used to get to me in Simon's Town South Africa.I would also like to for instance do a ping on packet radio to find out how long a packet takes to get to its destination.The system will also be a general storing place for documents that folks can download over packet or email.

In conclusion,with the severe move to wireless communications by the commercial industry I think us hams had better start finding ways around the problems I am sure are going to crop up and get any commercial folk off our frequencies especially 2m and 70cms.This system although it seems commercial is purely for ham radio and if inroads are made into this service by commercial companies the service will be shutdown as it is for non -profit.

Give me some ideas of what you are looking for and a way to accomplish them and I will certainly give a it a bash.Otherwise if you do not know how then send the idea anyway as I am sure in the future I can find a way to do what you want.

Regards
de ZR1HPC

FSK mode inherently does not permit the injection
of any audio so you can't use it with PSK31. If
you modify the TS-940 to use the narrow CW filters
in SSB mode can you not select some PSK signal
other than 1000 Hz in order to put it in the
filter passband? This is what I do with my
modified IC-761. A 1500 Hz tone falls in the CW
filter passband on this rig.

Richard C. Ferryman <106255.1565@compuserve.com> wrote:
>Any packet /pactor operators in Texas? I would guess there are!

There are stations in Texas. For packet, I work NT5K-1 on a regular basis. There are about three stations that I mysteriously can work all hours of the night/day, and NT5K is one of them. His station is on 14105 MHz. I am not sure of a route to use from the UK. The 'NET 105' network on 14105 is highly organized. I am sure you could link to NT5K-1 from a station on the eastern coast of the USA. I have enclosed the NET 105 operators guide below.

For pactor, a very good list of stations is at

http://users.iafrica.com/z/zs/zs5s/buls.htm.

The PACTOR bbs's usually scan more than a dozen frequencies, so listing them here isn't a good idea. The stations listed in the latest bulletin located in TX are W5SEG, W5ZIT, and WB5KSD. I work WB5KSD on a regular basis on 20 MTR.

Also, I have good luck working the UK direct on 10 METERS during the mornings around 17:00 UTC. I am in Minneapolis, Minnesota at EN34iv. Most of the packet activity on 10 Meters is around 28105 MHz (300 baud). The station KA1RCI is a full service BBS on that frequency.

Here is the NET 105 Guide for operating AX25 on 14105. Good Luck !

-----CUT HERE-----
MSG#1 18 OCT 18:57Z FROM VE1AMA TO NET105
SUBJECT: "NETWORK 105" Intro!
PATH: VE1AMA

Hello and welcome to "NETWORK 105". The network is made up
of hams who use their tncs as KA-Nodes, NETROM, Netnode, PK-Nodes and
JNOS TCP/IP nodes, or any multiported nodes providing point to
point or cross over to vhf from hf, and from hf to vhf capability.

"NETWORK 105" has been in operation since June 11, 1986 and
all stations are here voluntarily, providing help, encouragement,
keeping folks in contact and also a base for further expeimentation
on hf packet. I encourage you to use the system, and any suggestions
you may have, please leave at my PBBS, or at one of the following
KA-NODE "NETWORK 105" co-ordinators helpers:

WG9V-7, Jan, Official Observer - regional co-ordinator (Operates JNOS)
WB4QOJ-7, Lee, Roanoke VA. BVDS home page "NETWORK 105" list server.
VA3HRA-7, Harvey, Exeter, Ontario.. lots of help and support.. JNOS.

WA4JAF-7, Ken, Ft. Pierce, Florida regional co-ordinator/helper solid stn.
K9SLQ-7, Wayne, Bluffton, IN, original 1986 member, co-ordinator.
KR4MS-7, Nick, Athens, GA. Links to the South..
VE2CJT-7, Jean-Guy, Bourcherville, Quebec, new on "NETWORK 105"
N4BG-7, Ben, Roanoke, VA, one of the original co-ordinators.
VE3CDZ-7, Adviser/Helper/Co-ordinator
WB3IWY-7, Gerry, TheNet X1J-4 node, Warren, PA, good support strong netnode
VO1CT-7, Wayne, Placentia, Newfoundland, Co-ordinator (Newfoundland & East)
KD4PWK-7, Berea, KY. KA-Node also help for PK-232 users.
WA8RSA-7, Dave, Zeeland, MI, (also sometimes JNOS)
VE4JA-7, Jack, Russel, Manitoba, Co-ordinator Manitoba/Saskatechewan JNOS
N8DA-7, Dana, Homeworth, OH, JNOS new to "NETWORK 105", good links.
WB8HRO-7, Tim, Howell, MI, KA-Node.. help in MI.
VA3IKJ-7, Ike, Unvionville, ON, Link to Toronto.
AB4YY-7, Mike, Front Royal, Virginia, maybe netnode or KA-Node.
VE3DOU-7, Peter, Hamilton, Ont. excellent signal, crystal controlled ops.
W0UI-7, Woody, Franktown, CO. long time KA-Node - helper.
K9VSO-7, Jim, Madison, WI, has two KA-Nodes on two different bands.
KR3C-7, Tim, James Creek, PA. JNOS-TCP/IP much support and experimenting.
KF4PUX-7, Hank, Richlands, NC, good strong North to South connections.
KC5HNH-7, Randy, Wilson, TX, new KA-Node link to Texas
KB8OOR-7, Bill, South Point, OH, new active station.
KB8OLF-7, Dave, Detroit, PK-Node, good strong links. help for AEA users.
W6ABC-7, Jack, Oakland, CA.
KC4UBU-7, Geoff, Coeburn, VA.
SL0AX-7, Per, Sweden, KA-Node.
VE3ON-7, Norm, Ajax, Ont. part time, PK-Node
VE7DGM-7, Bill, Vancouver, BC
W9YHY-7, Damon, Indianapolis, PK-Node, access to Amprnet (w9dcc)
TI2YO-7, Minor, Costa Rica, may have JNOS or FBB operational welcome Minor
DA1HR-7, Randy, Mannheim, Germany
N0SLZ-7, Perry, Kansas City, KS.
VE3XZT-7, Dale, Almonte, Ont.. PK-Node route to the nations's capital Ottawa.

VE1AMA-7, VE3DOU-7, KB8OOR-7, VO1CT-7, and N0SLZ-7 are all crystal
controlled stations if you wish to tunee to either station as a
reference frequency.

We are in the midst of expanding, and are looking for stations in
the West and Midwest both Canada and USA. Also looking for European
Stations.
Looking forward to hear from you. Please support "NETWORK 105",
by using the SSID set of:

-1 for PBBS
-2 for GATE
-7 for KA-NODE, NOSnode, NETROM, G8BPQ, all nodes.

generics. PBBS term for any built-in-the-tnc mail systems.
JNOS or TNOS TCP/IP type stations NOS = Net Operating System
AMPRNet - AMateur Packet Radio on the interNet) stations

that have RF as well as Internet wormhole connections
Netnode - a local network vhf node.
LAN - Local Area Network.

If you are not using a KAM, please set the following parameters:
FRack 5, DWait 0 on hf - FRack 6, DWait 0 on vhf
Paclen 60 HF, 128 VHF, Maxframe 1 HF

If you want good performance, please DO NOT DIGIPEAT A CONNECTION,
it is much better to connect to a node - and then use that node to
connect to the station you want. You will only spend 90% of the time
retrying and getting RNR and REJ frames if you digipeat the connection.

Also PLEASE use CALLSIGNS, and NOT ALIASES. Let's keep it HAM RADIO.
No "HANDLE" type calls please, as they can be duplicated, while only you
have your own call. At one time we had two stations using VAGATE on the
network. It surely caused a mess.

If you run an MSYS system, please use the netnode with -7
as opposed to the MSYS version of KA-NODE, (K-node). The
move is to make the -7 indicate a multiported node whether
it is a KA-Node, JNOS, NETROM, or any node that is
multi-ported. Users will be able to figure it out after
exploring it a bit.

There are no full server BBS to BBS forwarding systems on the
network, or at least we hope there are not. Please support
and enjoy the network. It can help you get where you want
quite efficiently.

Those stations that wish to run one of the various BBS systems
as an extention to their own systems, no problem, but please
no BBS to BBS forwarding, and no nodes broadcasts...

TCP/IP stations wishing to join the network, again no problem
but please no File forwarding as it would choke the system.
TCP/IP is a very powerful system, and for the network to be
able to get to know and use it, is a good idea, and you are
most welcome here.

Thanks and hope to hear comments soon.
All the best.

Does anybody know how I can digitize my old records and put them into a MP3-
or WAV format.
Thanks
Lodewijk

Plug your record player into the line-in and use something like Adaptec's CD creator deluxe.

I don't know if this is possible, but if you have the RS-232 interface for the 940 and some was to modify your PSK software, you could switch modes when you go from RX to TX. I did this with some custom PSK software and my Kenwood TS870. I switched between SSB for TX and CW for RX. It was a little easier on the 870 as you have to compensate for the CW offset when switching modes. On the 870, the pitch is set digitally, so it was easy to do. On the 940, the setting is a knob and I'm not sure how the settings compare to the offset frequency.

On the 870, I found that when the other signal drifted badly, the audio AFC would often move the signal outside the 50 Hz passband, so I had to open up the filter. Finally, I ended up modifying the AFC to adjust the VFO to keep the other signal centered in the passband. The only problem was that my TX signal would also change so we could end up chasing each other. I never got and further than that, but I would probably have been better to adjust the RIT rather than the VFO.

A less elegant approach on most radios is to operate split. Set the RX to use CW and adjust the frequency for the CW offset. Set the TX to use SSB. The only problem is that RX and TX won't track each other.

73,
Mark, N8ME

P.S. I just recently fired up my old 940 (16 years old and it's still a great radio) and I will be putting it on PSK once I get an interface built (it's not difficult, I've built several, it's just a matter of finding time <g>).

272. Hamcomm Interface Question

Newsgroup: rec.radio.amateur.digital.misc

273. Experience with PIC16F84 programmer?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-19 00:00:00 UTC
From: Kees Leune <kees@kub.nl>
Message-ID: <863rii$b4j$1@mailnews.kub.nl>
Source record: 14559

For the last couple of days, I have been trying to brew together a programmer for the PIC16F84 microprocessor. Until now, I have tried two designs, both of which connect to the serial port of my computer. The first design is a really basic design which is known as Ludipipo and is advised by the ARRL handbook 2000, the second was the design by Jens Madsen.

I am pretty sure that I built the circuits properly. The software I tried to use is MPLAB of Microchip to compile the assembler code to machine code and PIX to write the code to the writer. The code assembles fine, but PIX will break. Other software refuses to load at all.

The computer that I'm using is a Pentium II running Windows 2000, DOS and Linux. I tried on all platforms, but no success anywhere. The serial port appears to be in working order. Using a modem does not give any problems and I read the right voltages on the pins too.

Before I am going to try yet another design, I thought that I'd check here to see if anyone has experience with building a programmer for the 16F84. How did things work out for you? Any tips, hints or other obvious things that I should look at?

Thanks!

274. DSP-232 Upgrade

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-19 00:00:00 UTC
From: rudder_NoCannedOffal@gulfcoast.net
Message-ID: <8EC05E0F1zzz@209.26.110.222>
Source record: 14560

Has anyone here purchased the DSP-232 upgrade from Timewave? According to their web site, the upgrade contains version 7.2 firmware, along with PC Pakratt 3.1 or PK'Term'99, depending on whether you want to spend $50 or $70.

My DSP-232 has v1.0 L31 roms, which I *believe* was AEA's last release. The jump from v1.0 to v7.2 seems like a rather large change if all that was fixed was the Pactor turnover problem.

Any comments on the new roms (or the accompanying terminal software) would be appreciated.

Hi Malcom,

I purchased PKTerm99 first then the firmware upgrade with PakRatt 3.1. PKTerm99 is very nice and the ease of updating it when new versions come out is nice. PakRatt 3.1 is okay, I haven't fiddled too much with it since PKTerm99 is superior. The firmware upgrade also includes a resistor upgrade to increase sensitivity and it really makes a difference. I know for RTTY it made a big difference. I have only dabbled with Pactor but I know the upgrade gave me near flawless receive capablity. If I had to start off at square-one, I'd go with the firmware 7.2 with the PKTerm99 since it's the better value for a better program. Good luck on the decision & I hope you get more input to help you decide.

I've never gotten any serial programmers to work on my system. So I
use a parallel port version (no parts PIC Programmer) and it works
fine.

Hy!!

I can tell you that LUDIDIPO works very good. I made myself one of
those a couple of years ago, and worked well for a long time.
Atention please: it does not work in all computers. Some of the newest
ones dont work, but if you have a old PC, running only DOS, you can
work well !! Just use MPASM for dos and there you go, you dont Fuking
windows for nothing.....long live Linux......

Well, since the WW server is a function of the Internet, not Ham Radio, there is literally no advantage whatsoever in accessing it through a packet/Internet gateway. In fact, it just tends to slow things down when you do, to no particular purpose.

Try using telnet, utilizing the same Internet access you used to make your post here. You'll be amazed at how much better it will work when used as intended, instead of going through the formality of QRM'ing your local packet freq so you can access it through a gateway.

287. FS: Homebrew Accessory Interface for TenTec Pegasus

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-21 00:00:00 UTC
From: Mark Erbaugh <mark@nospam.microenh.com>
Message-ID: <388877b3$0$6247@news.voyager.net>
Source record: 14573

I recently evaluated a TenTec Pegasus and decided that, while the radio was nice, it wasn't for me, so I returned it under TenTec's 30-day trial. During my evaluation, I built a homebrew accessory interface, described below. If someone is interested, I'll sell it for $40 US including shipping to a US address. If not, I'll scavenge the parts for my next project.

This interface was built in a modified 25-pin ABCD switch box (metal) and allows the connection of up to 4 accessory devices which are then switch selectable. Both audio out and in is isolated with a 1:1 audio transformer and have 5k pots for level adjustment (a lot easier than messing with the Windows volume control). There is an RS-232 / TTL level interface converter (a transistor, 2 diodes and a resistor, no opto). The RS-232 interface can be selected to be driven either by RTS or DTR line so it should be adaptable to most Windows soundcard interface. There is a molded cable with 5-pin DIN for connection to the Pegasus.

The pinouts are (25 pin DB25 female on box)

4 : RTS (can be switched to control the accessory PTT line through level converter)
7 : Ground
9, 10 : Audio from radio
11, 12: Audio to radio
14: PTT direct (can be switched to the accessory PTT line)
15: CW direct (can be switched to the accssory PTT line (see note))
20: DTR (can be switched to control the accessory PTT line through level converter)

note: The Pegasus only uses full break in keying. I discovered that in CW mode, keying the accessory PTT line was the same as keying the key jack, thus I didn't wire the interface to the key jack.

The pins described above are a subset of my internal 'standard' interface. My standard also includes FSK keying, which the Pegasus does not support. When I get a new radio, I build an interface from the radio to this pinout. When I get a new accessory device, I build a cable from that pinout to whatever the device needs. Because all the interface hardware is in the interface, the interface to device cable is just a matter of putting the right connectors on, no additional hardware is required. With this setup, I minimize the amount of new cables that need to be built to interface a new radio or external device.

It is a simple matter to build a cable between the interace and a computer sound card and serial port. The interface is designed to be adjustable to work with most Windows & Soundcard software, so when a new program comes down the pike you shouldn't need to make a new interface. Note: this does

not have a HamComm style A/D input into the serial port.

If you're interested, let me know. Remove the NOSPAM from my email address for personal email.

73,
Mark

288. Interface question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-21 00:00:00 UTC
From: Mark Erbaugh <mark@nospam.microenh.com>
Message-ID: <38887d83$0$6810@news.voyager.net>
Source record: 14574

I am building an accessory interface for my Kenwood TS-940. On the 13-pin ACC2 connector there are pins labeled Mic Mute and Standby (PTT). On my TS-870, pulling the Mic Mute line low also causes the radio to transmit, but with the front panel Mic Input was disabled. It seems that on the 940, this is not the case. Pulling the Mic Mute low does not force the radio to transmit.

Thus, I think that I need to build my interface such that when the computer pulls the Mic Mute line low, it also pulls the Standby line low. However, I don't want to wire the pins together, because there may be times when I want to pull Standby low, but not Mic Mute, such as if I have an external PTT footswitch.

Thinking of a diode as the electronic equivalent of a check valve, it seems that a diode between the two pins would do the trick, but I can't quite get my brain around the concept. Will this work? How does the voltage drop across the diode figure into the picture?

The best programs use a simple data modem/converter
connected to the serial port or the parallel port.
Programs using the soundblaster are not-so-good.

I recommend CODE3 from HOKA, http://www.hoka.com
or RADIORAFT, a DOS program.

You don't need a scope. Just look at the ALC or RF power output on the rig's meter when adjusting the POT for the mic input level.

The HAMCOMM interface works okay with strong signals BUT it doesn't have any filtering.

You will notice a HUGE difference on receive if you put a RTTY, SSTV etc Audio filter before the HAMCOMM interface.

You an build just a AF filter but it is probably cheaper to pick up a used audio filter at a HAMFEST. Many manufacturers make them. You don't need one designed for RTTY or SSTV. Many SSB filters with adjustable low pass and high pass filters will work just fine.

You can also buy a kit called VOLKSRTTY II which is essentially a HAMCOMM interface with a bandpass audio filter in front on the HAMCOMM interface. The bandpass filter is designed for RTTY and AMTOR. IT is not designed for SSTV.

VOLKSRTTY II works great with HAMCOMM 3.1 software.

The VOLKSRTTY filter also provides separate MARK/SPACE signals so it can be used with TERMAN93 software for PACTOR transmit and receive.

There isn't much AMTOR left on the HAM bands. PACTOR is more popular.

Details on VOLKSRTTY II can be found at http://home.att.net/~k7szl/

There is also a link for the TERMAN 93 software on this page. TERMAN 93 is freeware.

Good luck

294. PKTerm '99 version 1.4b released

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-21 00:00:00 UTC
From: Rick Ruhl - CSS <ricker@cssincorp.com>
Message-ID: <fP2i4.13949$wk.180732@news1.mia>
Source record: 14580

PKTerm '99 version 1.4b released

CSS, XPWARE and Timewave team up to find firmware issue with PK-232

Florence, Alabama. January 21, 2000: Creative Services Software announced today that an updated version to PkTerm '99 has been released. Pkterm '99 release 1.4b overcomes a firmware issue that has been in the PK-232 TNC for 15 years.

On Sunday, January 16, 2000, CSS, XPware and Timewave teamed up on a 2-hour conference call to discuss a problem that has been plaguing programmers who use the AEA Host mode in non-polling mode. The focus of this discussion finally put a pattern to replicating the firmware issue.

Rick Ruhl, President of CSS said "I was very happy to work with Gary Johnson of XPWare and Randy Gawtry of Timewave to finally put some detail to this dropping character issue that has been reported. It was quite a team effort to narrow it down, and the results of that are better products from all the companies involved".

The update is on the web at http://www.cssincorp.com/pkterm . It is a FREE update for current owners of any of the previous PkTerm '99 versions.

Creative Services Software is at http://www.cssincorp.com

Windows, Windows 95, Windows 98 and Windows NT are Registered Trademarks of Microsoft Corporation.

For TCP/IP (internet) via packet radio, you'll need an IP address. THe list of coordinators (for which you'll have to find the one for your state) is in the ftp://ftp.ucsd.edu/hamradio directory (look for a filename like "amprcoord.txt" or something similar). The same coordinator might be able to steer you to other local information for your area.

Rob,

Actually the solution is simple but depends on the way you implement your host packet parsing algorithm. The biggest problem was finding the way to replicate the problem. It was an intermittent issue in single character mode.

What we found was in single character mode, intermittently, the PK-233 (or PK-900) would drop a trailing <ETB> if multiple commands were sent to the TNC. As an example, sending ZSTATUS and ZFREE while receiving BAUDOT. The TNC would end up dropping the trailing <ETB> on the command return, and would end up becoming part of the next data packet from the TNC. Gary and I feel it's something in the buffering and/or handshaking, and Timewave is going to have the original firmware coder look into the firmware to see what is going on.

Of course the solution is to assume an <ETB> if you get an <STX> and are not in transparent character mode. Again this depends on how you parse the host packet, to provide a workaround in your code.

Hope this is of use to you.

There have been other problems with buffering and handshaking in the PK-232
before, so probably it is even better to let someone else than the
original coder have a look at the various buffering and handshaking
routines in the firmware. Maybe the original coder just wasn't/isn't aware
of some of the technical aspects of ringbuffers, interrupt handlers and
handshaking.
(in the first versions it was very easy to crash the PK-232 by sending data
and commands to it at a high rate)

I
I'M Using PKTerm '99 with a PK-900.

In VHF mode, I connect to a local BBS and do a "SP Stationxxx@BBSyyy" to leave a message there. At the end of the text in the message, the BBS wants me to send a CTRL-Z so it knows the message is complete and saves it. However, nothing happens when I try to send the CTRL-Z. I believe that just the carriage return is being sent. Can anyone tell me what I'm doing wrong? Thanks,

Warren AA2LQ

Use <Shift-CTRL-Z> Warren. Many control characters that BBS's use are
internal windows command <CTRL C> is copy, <CTRL Z> is undo. So for many of
those commands, we implemented a shift in front of it. Look under the TNC
menu for the menu equivalents of these 'hotkeys'.

I don't know about a possible problem in your software (maybe it does
not like to send control characters, or you have to change some setting
somewhere?), but most mailboxes also have a text-only end-of-message
sequence, like:
/EX

Hi Gang,

I have a 28 volt, 5 digit display unit on eBay. This unit comes from a gas pump and is designed to project digits 0-11 through a clear or frosted glass/plastic window. It would make a unique display for a homebrew radio project. See it at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=244254965

Starting bid is just $2 plus shipping. Thanks for looking.

Radio Randy

question re connecting D7 to Palm--saw the diagram online for the wiring but wonder what the hotsync cable is like.

I got a hot sync cable -- has anyone cut the computer connector off it? Can I simply stick a 2.5mm stereo plug on it? ARe the wires coloured? Sounds simple but hate to waste one.

The alternative is to join a hotsync cable via null modem to a computer to D7 cable but that makes a much bulkier package.

Thanks

Paul

I saw a reply to your posting, never saw the original..
Anyway, check out my web site. I have two versions of a KW 140/440/940
control program there. One is for Windows and Linux using the Tcl/Tk
scripting language that is FREELY available at www.scriptics.com. Links
are on my page and if you have any questions just send me an Email.
The second is a Linux/Unix only that uses the Xforms library...
Both come with source code.

315. Y2K glitch in DOS version of PcPakratt program.

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-23 00:00:00 UTC
From: Radio Randy <rjones@theofficenet.com>
Message-ID: <u7Si4.1472$%C5.85096@news.uswest.net>
Source record: 14601

Hi gang,

This may already be known but, there is a glitch in the DOS PcPakratt program. Apparently, when you start the program, there is an error message that states simply "Bad" but gives no other description. I have determined that the error is due to the date setting function of the software. I believe that the computer sends 00 or some such date to the PK-232 which, in turn, returns an error message as 00 is not a legitimate date to it.

I simply hit a key and the program appears to function normally. I have not looked at the date in the 232 after I start the program, it's probably wrong.

This post is to simply make this error known to those of you who haven't discovered it yet. It does not appear to constitute a serious problem.

73, good luck and Happy New Year <grin>

I have been on packet radio for a while now but would like to try something new. I am interested in setting up a packet gateways and bbs system. I have a tiny-2 TNC (KISS compatible), VHF radio, ADSL internet connection, and a PC (P133 32MB RAM, 2GB HD, SB16 Sound card, with WIN98). I have done some research and think I know the basics. I am a computer tech so I do have some networking experience. I am wondering what is the best software to use to set up such a system. Any pointers would help. I would prefer windows or dos software but I do have a similar configured system running redhat 6.1 but I am still learning Linux :-) Thanks for the help.

Message-ID: <An%i4.2288$2z.15012@newsr1.san.rr.com>
Source record: 14606

Hi All,

Kenwood says that the new TM D-700 will work on the 9600 baud pacsats, but I have yet to hear if anyone has actually reported success. Has anyone done it yet?

Does the radio work with WiSP? The manual lists a KISS mode command so it should work, but has anyone tried it?

Also important -- can the VFO's be controlled via the serial port for full duplex doppler tracking of the pacsats? If so, where are the commands for this? I looked through the manuals briefly and could see lots of the normal TNC commands, but nothing for VFO control...

I know that Kenwood has a program in beta test on their Web site for programming memories on the D-700, but am not sure if that would be useful for doppler tracking... Any experiences yet???

323. Bug in KANTRONICS KPC3 and KAM firmware?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-24 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <2J8j4.209511$5r2.569438@tor-nn1.netcom.ca>
Source record: 14609

I think there may be a bug in the KPC3 and KAM firmware. Perhaps it exists in all the KANTRONICS firmware.

I can only upload small messages to the KPC-3 or KAM for transmission. If I try to upload large messages, a few characters always get lost.
I am using a good RS-232 cable with HARDWARE handshaking. The settings in the KAM and KPC-3 select hardware handshaking.

When the input buffer in the TNC gets full, I believe the TNC signals the PC's buffer (ie 16550 UART) to stop sending data. I believe this signalling happens too late --- The TNC's buffer doesn't have enough room left in the buffer to accept the few characters queued in the PC's UART.

There are two solutions -- run the baud rate between the TNC and PC at 2400 baud. But that is not a great solution for high speed 9600 baud KANTRONICS TNC's

The other solution is to change a setting in the Windows control panel's DEVICE MANAGER. Select the COM port, and then select properties, port settings, advanced. Leave "Use FIFO buffers" checked, but move the Transmit Buffer slider fully to the left. This disables the transmit FIFO on the port, but leaves the receive FIFO full functional.

I have not seen this problem with other types of TNC's. It appears to be unique to KANTRONICS TNC's.

Has anyone else encountered this problem?? Has KANTRONICS fixed the problem in a later firmware release??

Hello Radny,

The Y2K glitch also extends intp version 2.0 and earlier versions of PC PakRATT fior Windows. There is a version 2.1 upgrade available from Timewave for $29.95. You can also download PK TERM 99 (for WIN95/98 etc) and try the program in a demo form.

Source record: 14612

This is normal for the TNC's we've written code for. Once the TNC buffer is full, if anything else is sent to may get lost.

The way we worked around it, was to not only test to see if there was room in the buffer left, but also wait for unacked packets to be acked if connected. Of course, the Kantronics host mode is really the only way to do this effectivly. Running a program that's not a host mode program has no way to check for the free buffer bytes, or unacked packet.

You should find documentation about this in their host mode programmers guide, on the kantronics web site.

The proper way (to solve the problem mentioned in the original message)
would have been for the TNC to do the handshake procedure (send the XOFF
or lower the handshake line) a few (16-32) characters BEFORE the buffer
actually is full. This allows the sending system to stop in time to
prevent the buffer from overflowing, especially when a hardware FIFO is
also present.

Many TNC-like devices have broken handshaking routines and drop characters
or even crash when you stress the handshaking.

329. ASUS SP97-V Motherboard problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-25 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <F42BNKAtXcj4Ewi2@dowrmain.demon.co.uk>
Source record: 14615
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

I'm using a Watford Electronics Aries PC. It has an ASUS SP97-V
motherboard, with a Pentium 55C running at 200 MHz.

Everything works well, except the CR2032 lithium BIOS backup battery
dies within a couple of months or so (instead of every 12 months or more
as I might have expected).

Any ideas why the battery lifetime is so short? Is there anything I can
do about it? It really is a pain in the subroutines to have to open up
the box every few weeks to replace the battery.

The problem also applies to the Windows version of PcPakratt. I
suppose that it is too much to hope for there to be a free patch for
these programs to restore them to full functionality. Where are the
hackers when you need them? :-)

It sounds like KANTRONICS should consider fixing this bug!

Maybe if enough of us complain, KANTRONICS will do something about it!

I have heard this firmware bug also exists in KPC-3 Plus, KAM Plus and KPC-9612.

I bet the handshaking routines used in the KPC-3 are used in the KPC-3 Plus! Similarly, I would be very surprised if the handshaking routines in the KAM were not used in the KAM Plus!

It would appear that a lot of the firmware in all their TNC's is the same! KANTRONICS appears to release new firmware updates to the KPC-3 and KAM whenever it releases new updates to the KPC-3 Plus and KAM Plus respectively.

In my view, this type of firmware bug is unacceptable for a company who makes TNC's not only for Ham radio but also for commercial users (and the military?)

Let's all EMAIL KANTRONICS and point out this bug!

I don't think its the KAM. Have many many reliable hours of satisfied operation with a KPC-3, a KAM, and a 9612. I don't try to force more down its mouth than it needs and the one cheap serial card that did drop characters I traded for another that cleared up the problem. Have run them under DOS, WINDOWS 3.11 and WIN 95/98 and used just about all the software out there at one time or another on five different computers from an original IBM Blue with dual full height 5.25 floppies/no HD to a AMD K2-350, two of which were trashed by lightning strikes while running TCP/IP. I'm not convinced you have a bug but I do note a lot of people kicking sand at Kantronics maybe unjustly in this newsgroup.

From the Kantronics web page (http://www.kantronics.com/hostmode.htm) with the host mode docs on it... doesn't matter if it's DOS, Windows, Linux, CP/M or a Commodore 64.. <g>

Buffer usage in the TNC

Proper implementation of flow control between the computer and the TNC requires that you understand the operation of certain buffers within the TNC. A simplified diagram of the buffers in the TNC is shown below. Note that data from the computer are first placed in the TTY input buffer. This buffer is then transferred to a second buffer, depending on the type of data.

Packet buffer

TTY Input Command buffer

HF buffer

Commands are transferred to a command buffer for processing by the firmware. Data which are to be transmitted on packet are transferred to a packet buffer, and data intended for an HF mode (e.g. RTTY) are placed in the HF buffer.

Those TNCs which do not support HF modes will not have the HF buffer indicated above, but will have the Packet buffer and Command buffer.

The size of the buffers can be determined by using the STATUS command. When operating from the command mode (cmd: prompt), giving the status command will return a line indicating FREE BYTES. This indicates the number of free bytes available in the Packet buffer.

As data are moved into the packet buffer (from the TTY Input buffer), the data is queued for transmission over the radio. Since the radio speed is generally much slower than the computer-to-TNC speed, it is likely that new data queued for packet transmission will eventually fill the Packet buffer. When this happens, the data backs up into the TTY Input buffer. When the TTY Input buffer is nearly full, the TNC will cause the CTS line to go inactive, providing hardware flow control and stopping data from the computer.

An important point here is that the TTY Input buffer is a FIFO (First In, First Out) buffer. Since commands to the TNC must pass through this buffer in order to reach the command buffer, any data already in the TTY Input buffer must be processed before a command can be processed. A well-written program will, therefore, check the status command periodically and never permit the FREE BYTES number to reach zero.

When operating with a TNC that supports HF modes as well as packet, the STATUS command reports two numbers in the FREE BYTES section. A typical response might indicate "FREE BYTES 1520/3040", indicating 1520 bytes free in the packet buffer and 3040 bytes free in the HF buffer. As long as your program never allows free bytes to reach 0, you will be able to issue commands to the TNC. Note that the status command will only show two numbers if the TNC is currently operating in the packet mode and simultaneously operating an HF mode. This is only possible in host mode.

Some manufacturers still care if a product is actually working according to
spec and/or reasonable assumption long after production has been
discontinued.

You don't mention what type of software you are using with your KAM.

I suspect that you are using a HOSTMODE program with the KAM. As pointed out earlier, programmers who use KANTRONICS hostmode can work around this bug by checking the amount of free space in the KAM's buffer.

But if you use a simple terminal program and send a large brag file to the KAM in its TERMINAL mode, you will likely see dropped characters.

I have used three different types of computers from an old 386 running DOS and Windows 3.1 to a fast Pentium II running at 300 Mhz. No matter what type of computer I use, whenever I send large files to the KAM or KPC-3 to be transmitted, characters are dropped when using the terminal mode of the KAM or KPC-3. My hostmode programs don't seem to loose characters.

I also have the same problem when running the KAM or KPC-3 in its KISS mode.

It shouldn't be necessary to use the KANTRONICS Hostmode (to constantly check the KAM's or KPC-3's buffer), handshaking properly implemented should stop the computer from sending data when the KAM's or KPC-3's buffer is full. That is the purpose of handshaking!

Rob

Well, try sending a large file to the KAM with a program that DOES NOT USE hostmade.

Any modem works fine for 1.2 kbps packet. There is no "better."
It's all obsolete stuff from the 80's.

If you're "serious about Packet Radio" I would recommend using
Linux and the soundcard modems, with the 4.8 kbps version
working very well into regular audio based radios. There's also
a ROSE network mode that works very well for links.

One reason we purchased the PakRatt source code was to fix the Y2K problem in PakRatt for Windows and move the 'best of' PakRatt to the CSS 32 bit product line. We did this and released through Timewave version 2.1, which not only fixes the Y2k issues, but adds additional TNCs and features.

The problem is that PakRatt 2.9 used the 'tm' date structure, in which the 'year' variable is number of years since 1900. Since the code had to be rewritten in a number of places, there would be no simple 'patch' to fix this. If there was, we would have released it as a patch.

Also there had been many other additions to PakRatt from version 2.0 when we bought it, so there was no actual 2.0 source available, again making a patch option not viable.

Agreed, the people at Kantronics are good people, and I have worked with
them for the past 3 years with no complaints.

I'm sure Ken Baker will see these messages and pass them on. He's been
known to lurk in here in the past. <g>

351. Re: Bug in KANTRONICS KPC3 and KAM firmware?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-26 00:00:00 UTC
From: Mike Wiley <wb5gmk@flash.net>
Message-ID: <uWwj4.4243$rl6.71491@news.flash.net>
Source record: 14634

No the programs weren't all hostmode, some were terminal mode and some were KISS mode.
I had two instances of data problems 1. Trying to cram TNC CMDS from a config file using a popular modem program without waiting long enough for the tnc to acknowledge, which the fix was to add wait states into the upload file. or 2. when I had the crummy serial card which affected all modes even HOSTMODE and KISS and at any serial baud rate (which doesn't need to be 9600b for a 1200b packet radio). Seems like at the time we even tried some different packet drivers for windows to no avail. I have sent some 241k files using NOS with no problem.
As to simple terminal programs never had much use for them except for the ones built into some of the DXcluster and logging programs.

Maybe your bragging too much?

Sorry ur having probs-good luck.

>Kantronics maybe unjustly in this newsgroup.

I can assure you that whatever was the current version of the KAM
firmware three years ago most certainly had the bug, as did the KPC-3
and 9612 at that time. I reported it to Kantronics, but didn't receive a
reply.

Since then I've seen enough comments about the problem to be fairly
certain that the bug continued to be present in later versions of
firmware. I'm certainly not "kicking sand", but with a few thousand
users of my WinPack software around the world, I very quickly become
aware of which TNCs cause users problems. This particular Kantronics
problem is so common that I produced a FAQ about it.

In fact, I can't think of any other problem with a popular make of TNC
that is a genuine bug in the TNC as opposed to users having problems
correctly configuring it.

>do winblows on pc's. I use dos, os/2, linux, cp/m and others. Could it
>be a winblows problem?

It's a problem that occurs when the TNC is used in terminal mode with a
buffered UART, at a terminal baud rate greater than 2400.

When the TNC's input buffer is full, and it lowers CTS, the PC is still
likely to send a few characters. That is perfectly normal behaviour.
With Kantronics TNCs, this results in characters being dropped. The
problem is extremely easy to reproduce.

As a final comment, because this thread is obviously going nowhere:-

1. The problem definitely occurs - hundreds of users can't all we wrong,
and it can be very easily demonstrated.

2. I know of no other TNCs that have the same problem - every other
manufacturer seems to have managed to correctly implement hardware
handshaking for many years.

3. Saying use Kantronics host mode, and quoting chunks of the host mode
spec, is not the answer. Certainly in terms of PMS software, the host
mode programs are usually inferior in terms of the facilities they
offer, and more expensive, than some of the programs designed for use
with a wide range of TNCs.

From: Gerry Pieterse <tgerry@global.co.za>
Message-ID: <388eb6ae.0@news1.mweb.co.za>
Source record: 14637

I have an upgraded (with Timewave's DSP kit) AEA PK-900 TNC which I would lik to run with WinPack for the convenience of automated uploads and downloads from my local BBS. The problem is that even though the TX appears on the TNC screen, it does not send a transmit signal to my transmitter.

The curious thing is that if another packet station logs on to me, I am perfectly capable of conducting a two-way conversation ie. it then transmits. It seems that the incoming packet signal activated the TX facility.

I would love to hear from anybody out there using the PK 900 and WinPack (Ver5 6.42) and how they solved the problem.

Please reply direct to:

tgerry@global.co.za

>this. If there was, we would have released it as a patch.

That is not a problem. The number of years since 1900 now is 100.

The problem is that so many programmers assumed that the had to put
that variable after a fixed string of "19", e.g. in constructions like:

```
printf("the year is 19%02d", tm->tm_year);
```

This is WRONG. it will print 19100 as the year. it should read:

```
printf("the year is %04d", tm->tm_year + 1900);
```

when one is only interested in two digits of the year, the proper
form is:

```
printf("the year is %02d", tm->tm_year % 100);
```

This will nicely print 00 as the year. Forgetting the % 100 will yield
100 as the year, with resulting field-width problems.

So, there is no priblem with the tm structure, there is a problem with
many programmers' incorrect interpretation of its contents. Likewise,
first releases of programs written by naive programmers often have the
month number off-by-one in the output. When it is April, the program
says it is month number 3. But that bug is often quickly fixed, as it
is noticed by so many users.
Unfortunately many programmers did not take that as a hint to read
the documentation more carefully before proceeding...

Actually it's more like this in the code:

printf("the year is 02d", tm->tm_year);

So the year will show up as 10. And of course, you're right on the money
with this. I've looked at your code on your web site, and it is good
code... and you know your stuff. :)

The Kantronics gear is pretty much a lost cause. Nobody who is serious about Packet Radio uses it anymore. Your best bet is to sell the gear to a die-hard Kantronics user, and let THEM be the fool. You can then use the money to help buy better equipment.

Mm, well...

1. printf("the year is 02d", tm->tm_year);
will print "the year is 02d", because you forgot the '%'. :-)

2. printf("the year is %02d", tm->tm_year); (which is what you probably
meant) will print "The year is 100".

You are making the common mistake (a cause of many Y2K bugs!) of
thinking that "%02d" means "print two characters, and pad with leading
zeros if the output would be less than two characters.". If you check
with your 'C' manuals, you'll find that it means "print *at least* two
characters, and pad with leading zeros if the output would be less than
two characters.". So, given that tm_year is now 100, the output from
"%02d" is "100", not "10".

This depends on the text editor you use. There is no general method
aside from the obvious "hold down Ctrl and press D", which will not
work when the editor chooses to ignore characters entered like that or
will execute some special command as a result.

In trying to answer that question, I found myself in a quandary... There are so many better brands to recommend, with "the best" being a matter of personal taste or particular need.

As for those of you who are proud that your Kantronics equipment "works", I'll mention the case of a neighbor whose Yugo automobile "works"... It gets her to town every day. That does not make it a superior design.

It appears some extra current drain is occurring. Why don't you measure the
current next time to see if it is what you expect, a few microamps. Maybe
there is a duff tantalum bypass capacitor ?

-- Reposting this as it didn't appear last time ?!

Hi all,

I'm trying to write some Windows software to decode 1200 baud packet
(and perhaps other modes if I get any further !) but was wondering if
anyone has any info on the tones used etc...

I have the program getting the buffer from the sound card and putting it

onto a graph (looks nice !) but now comes the hard part : decoding the
buffer into packets ! Do I need to process the buffer with an FFT
routine first ?

Any hints, tips, pointers in the right direction gratefully received !!!

Andy

The Kantronics manual should contain instructions. If not, an easy way to set it is to listen with another radio. Set the ouput level to a very low value. Go into the test mode that sends tones continously. Listen on the other radio. Increase the output level a little and see if the signal gets louder on the monitoring receiver. Keep increasing the output level a little at a time until you don't hear any change on the monitoring receiver. Then back the output level off a little bit.

Now you have set the level correctly!

Hey Charles,

Check your 'audio drive' level. This is one of the more common problems. Use
the CALIBRATE command with another KPC3+ on the air. It's well explained in the
manual, it's easy to do and so far has solved the connect problems all the KPC
users in these woods have experienced.

Mine basically said to use a deviation meter, which I don't have one of, and
can't afford right now.

Thanks for the advice.

Charles

I have my TXLEVEL up to 300. Haven't found another KPC3 on the air yet for sure. Audio drive
basically unadjustable on the radio. Doesn't mention contacting another KPC3 on the air for this, it just mentions I should get a deviation meter, which I don't have and don't know where
to borrow one from. At 100 (default) I couldn't even hear the packet noise on the carrier on
another radio a mere 20 ft away. For the Kenwood, there is no hardware adjustment, according to
my manual, only the TXLEVEL command.

I guess we'd better get clear on what you've got there. You said a KPC3+ and
you mention the TXLEVEL command. My guess is you've an older firmware revision
there. Give 'er the ol VER command or note what it says on power up. The
TXLEVEL command isn't even available in the V8.3 firmware. I'm not sure when
the CAL command was added in, but I gotta admit, it's sure helpful!

As was suggested earlier, using the ol 'by ear' method of adjusting from no
tones to max volume and then backing the TNC off a bit will get you 'close
enough for government work', least as far as the TNC's audio drive level is
concerned.

Here's a link to more information about TNC drive levels, what they mean and
how to 'tweek' 'em

http://www.febo.com/layer-one/transmit.html

Good luck!

There are actually two problems here: telling the tones apart,
and telling where one bit starts and where the other ends.

You don't need to do FFTs to demodulate packet, though there are
multi-tone modems that *do* use FFTs.

To distinguish the tones you can use two filters, one on each
frequency. This is how many of the old analogue RTTY systems worked.

Alternatively, you can generate local versions of the two tones and
compute how much the incoming signal looks like them. This is the
preferred approach, and you'll want to look in a DSP textbook for
terms like "correlation" and "matched filtering". One wrinkle is
that since your locally-generated tones are not generally in phase
with the received tones, you generate sine and cosine tones,
correlate both, and then take a Pythagorean sum. This makes the
phase errors cancel out.

Telling when bits start and end can be hard to get right. You can
detect when the output changes (HDLC 0), but matched filtering
needs to know where the bits start and end in order to start the
integration and then dump the results. Catch 22...

A simple, but compute-intensive approach, is to initially acquire bit synchronization by sliding a bit-sized window across the data until you get the best results. You can synchronize a PLL for clock recovery when you detect transitions (HDLC zero bits), and use the results to decide when an HDLC one has come in. There are other ways of doing this. Anybody?

Thomas Sailer has written some good amateur-oriented stuff on the subject.
Have a look at http://www.ife.ee.ethz.ch/~sailer/ham/ham.html

Well, you're right and the ver says:

KPC3P-7ADC91-8.3

However it does have the XMITLVL command.

382. Re: Bug in KANTRONICS KPC3 and KAM firmware?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-27 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <7g6k4.214161$5r2.573427@tor-nn1.netcom.ca>
Source record: 14468

Hi Roger,

I sent an EMAIL to KANTRONICS on the problem in their firmware and asked them to investigate and fix it. I also invited KANTRONICS to post a response on this newsgroup.

I just received an EMAIL back from KANTRONICS. Normally, I would not post an EMAIL. But KANTRONICS' response was totally non-responsive. KANTRONICS should have stated clearly whether or not the problem will be at least investigated.
KANTRONICS simply stated:

"This type of problem has been reported before, but only when using some terminal programs in windows, and only during file transfers at high speed"

That's it. Nothing more was said. The problem was reported before but did KANTRONICS ever investigate it??

I see this problem happening at 9600 baud which I don't consider "high speed". It happens with ALL the windows terminal programs that I have used (that do NOT use Hostmode). KANTRONICS appears to be blaming Windows and/or "some terminal programs".

It doesn't sound like KANTRONICS will do anything to fix this problem in its firmware for the KAM, KPC-3, etc

Perhaps, KANTRONICS will listen to public pressure. If enough of us complain to KANTRONICS, this problem may be investigated and might even be fixed in later firmware releases for the KAM, KPC-3, KPC-9612, etc.

Roger, please consider sending them another EMAIL on this problem. I am sure many HAMS would love to use terminal programs, like your great WINPACK program, for sending large files using a KANTRONICS modem without having to worry about dropped characters.

Source record: 14469
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

G'Day,
I'm hoping someone can help me with a simple request which I'm asking on behalf of some microprocessor experimenters.

My main questions are geared towards building a low wattage (<500mW) transmitter which uses a removable crystal (27 or 40MHz) for frequency selection. The receiver would need matching capabilites (frequency modification via crystal subtitution) and AGC. I've a grasp on the concepts of FM Tx and Rx using PLL, but no practical experience. I have built my fair share of crystal sets, and so have an understanding of AM detection, but no experience using IF and subsequent mixers.

If someone has a URL for a "dummys guide to basic RF design" or something that would help (circuit diagram for RC Tx/Rx sets, or crystal based Tx/Rx pairs in the HF bands), I would appreciate it.
I'm using 27MHz and 40 MHz since they are the standard frequencies for RC cars in Australia. I plan on using crystals for RC cars (from high Q in Sydney) in my circuits. This way I'll be avoiding my experiments causing any issues with DOTC. The hoped for design will use a "data in" and "data out" pin in the transmitter, receiver respectively. I beleive that RC cars are limited to a bandwidth of 10kHz, so our processor designs would have to take this into account.

I would appreciate any assistance i can obtain. Most of us don't have a lot of the FR test instruments you would have, so designs which do not rely so heavily on these instruments would be appreciated, However if this reasoning is unreasonable, then please let me know. Please send info to des.bromilow@citec.com.au and to the list.

Many many thanks in advance,
Des Bromilow

Maybe because packet isn't so perfect. BBS's are dying off around my
neck of the woods.

When "packet radio" is what you want, at the speeds that are antiquated
but in wide use all over the world, you should not buy any box that has its
own microprocessor and presents itself as a TNC.
That is outdated technology, invented in the days when there were many
different kinds of computers in use in ham shacks, most of them
underpowered to run the AX.25 protocol. A unit like a TNC could present
them with a simple interface to the AX.25 protocol, adequate when the
average user used his computer only as a terminal (and it was sweating
to keep up with 9600 bps RS232 and writing the incoming characters to the
screen at the same time).

Today, 15 years later, the computer world has moved on and it is no longer
necessary to have a Z-80 in a standalone box to assist the main computer to
run AX.25. It is only a burden, as the link between the external box and
the main system presents extra problems that were not there in the first
place. This thread is about an excellent example of such problems.

So, when you want to run packet, choose between the following solutions:

- software (DSP) modem using a soundcard.

- external modem connected to a COM port that bit-bangs HDLC data
(the Baycom solution).

- external modem connected in a slightly more clever way, but still a
dumb modem without any AX.25 protocol knowledge. e.g. "YAM".

- SCC card driving dumb external modem(s).

Don't buy a TNC. Of any make.

Rob

Cool!

Yea - I thought there was some kind of Transmit Level adjust, other than the CAL command, thanks for finding it!

I've found that the inherent resistance of the TNC to radio cable can bugger things up a bit - special when one gets carried away and runs over 6 foot of wire <g>. (I gotta fix that one of these days...)

I'm running two KPC3+ TNCs here - one's a V8.2 here at the shack and the other is a V8.3 in the Ramcharger running as an APRS tracker, uses the 'virtual' serial port for the GPS input.

Here's the XMITLEVL values for each:

Truck (with it's, uh, over 6' of wire)
Radio is an HTX-202 (enough resistance in the wire, no need for an added resistor)
XMITLEVEL = 436

Shack (using 4 conductor modular phone wire, about 4')
Radio is an IC-2000H
XMITLEVEL=100

Using the CAL command is easiest with another Kantronics TNC. It gives you a number - easy to adjust. AT the least, listening to another station you can see what your receiving side is like.

Do you have a manual with the CAL command details?

I think it just needs better advertising to young people. Part of
the problem is the need for "instant gratification." Ham radio doesn't
provide that, so you have to aim it at people who are willing to put
in a bit more effort. With the Internet, you can "work DX" by buying
a cheap modem and dialing your ISP and getting on to IRC. With ham radio,
you have to take exams and spend quite a few dollars. If you just want
to chat, get on the Internet. If you want a challenge, go with the radio.

Hamish, 23 and enjoying ham radio for 1.5 years now.

LMAO!! Thanks Steve for offering this 'soap box' for me - this is fun!

(Steve, don't take this personal - I'm just using you as an example of what seems to be a popular viewpoint)

Do you ever get out or do you just hang out in your shack on HF SSB? Are you an active member of your local Radio Club? When's the last time you attended a meeting - just before Field Day? When's the last time you invited the local 5th grade class to your shack?

Letsee:
Many operators use LINUX - for APRS we have LINUX based servers, on the air (and on the I-net) - I personally have 3 PC's running full time for radio (P133, P200MMX and an AMD K6III-450), 1 LINUX and 2 Win98 - we're working satellites, several! - just did launch several more sats - The MSYS (and others) BBS IS Y2K (yup, there's an upgrade!) - the majority of our club members are college students (yea, a few are 'non traditional aged' but not all!) - there are several Scout Troops interested and involved with radio - last I checked my age was a LOT closer to 20 than 70, in fact the hams I 'radio' with (as my wife puts it) only one of them is over 80, and these days, that ain't 'old'...

I could go on, but you get the picture.

Here's one example of what's happening around here:
The local BBS (even after it was Y2K compliant) did shut down - N7MMC was a fairly substantial hub for Western US traffic. The operator has moved, some of his older gear died on him (he didn't die) and due to lack of involvement and $$ no one picked it up. We still have packet running all over the place - more than when the BBS was here - it's simply changed from 'store and forward' messaging to APRS. We use the I-net and/or keyboard to keyboard packet for routine messaging and APRS on the air for Ham stuff. My next focus for packet radio is working the 9K6 pacsats - actually going to take some effort here.

Instead of seeing change and new technologies as a threat (such as the I-net) we incorporate them, with their limitations in mind, into our systems and use them!

Things are simply changing Steve - not dying off. Sure, it may look like it's dying if what you're familiar with is no more. But it IS simply changing. Before you buy your rig a casket - expand your perspectives a bit and see what's really going on. If you don't find things happening in your neck of the woods - make 'em happen! Find a Scout troop or youth group and do a satellite session. Get out of your shack (if that's where you hang out at) and get into the world WITH your radio. If you don't want to make them happen - than you've

only yourself to look at for the death of radio in your area. It's the lack of participation and doing visible projects that makes it 'look like' ham radio is disappearing. The hobby itself is alive and well - just hiding.

Well I diddled around with my KPC3 Plus last night. Adjusted via the CAL command and XMITLVL now shows 260. However, I had to adjust TXDELAY to 100 before it sent anything like complete packets. At TXDELAY 30 (factory default) I got one burst of packet transmission out of 6 tries. Wonder if the radio doesn't like loading up that 70' of RG-59 between it and the antenna? 100 seems like an awful lot. Dug out my old, receive-only FT-470 just to check calibration and listen to signal working on TXDELAY. I'm using a standard MFJ prefab 3' cable between TNC and TH-G71.

BTW If you're running 8.3, Cal command is explained best by typing Help Calibrate at the TNC command line. There really isn't anything more in the manual except to explain that there is no longer a need to adjust an analog pot, as there is a digital pot controlled by the XMITLVL command. Also, Calibrate adjusts the XMITLVL, which the manual doesn't mention. I started with a 300 and ended up at 260 using the mark/space adjustment, but then I couldn't hear it 70 ft away running 5 watts.

I'm fairly sure I can't adjust that high. I have XMITLVL up to 350 right now and still haven't connected. 260 level is the right mark/space. Guess I'm gonna have to get a docking booster. I haven't connected yet. 512 is the limit on XMITLVL, default is 100. Running a 286 laptop into a KPC3 plus with 6' of serial cable, 3' of cable from KPC3 Plus to Kenwood TH-G71, 70' of RG-59U from Kenwood HT to J-pole. Running at high power, 4.5 watts.

Des, I recommend the ARRL Radio Amateur's Handbook as an excellent reference on how these things work.

Further, there is a company (name escapes me at the moment) in the US that manufactures a single chip receiver that requires one crystal and little more to make it operate.

In these days of cellular telephone excitement there are many companies making circuits for transmission and reception at low power levels and with a minimum of ancillary components. Of course, using these components will not teach you all that much about how to design radio circuits, but it does offer a short path to a working model.

If you have any specific questions, let me know.

73, Bob K6DDX

Got your attention this time?

I also said that none of the complainers about Kantronics,
or other TNCs, would be able to post specific suggestions
of what one might buy instead of a TNC.

Oh, yes, one can split the problem into it's parts:

Radio interfacing.
Computer interfacing.
Hardware protocol handling.
Connection protocol handling.
Network protocol handling.

One can do some of those parts in software.

However hardware is ALWAYS required: we ARE going
to hook up a radio you know (see, got your attention!)

So tell us about those "better" solutions.

Why better?
What cost?
Where purchase?
How much?

No answers?
I'm not surprised.

The TNC is obviously the best and cheapest solution.

If that were *not* true, you (and the other complainers) would
be able to provide answers. Give it your best shot.

Greetings,

I think I'm interested in building one of these. My eventual hope is to use it on the Packsats (9k6 G3RUH/Manchester). Looks like a very cost effective solution.

Comments and user experience?

Thanks!

Hank Oredson wrote
> > - software (DSP) modem using a soundcard.
>
> Will this handle 8 ports of 9600 / 19200 baud?

No, but then again 96.8% of Hams don't run more than
one port of anything.

I'd run a sound card before I'd run a TNC (Kantronics or
anything else for that matter). I have two DRSI TNC
connected to two 19200 Kantronics UHF radios I will
probably never use again. The TNC's just slow things
down.

9600/19200 baud is dead. No one is interested in those
speeds. 1200 and 4800 are the two most common AFSK
modes. I am one of 3 people running 9600, an d there are
5 times that many on 1200 APRS (in Oklahoma). It's just
a real big Ham packet activity here (not!).

Steve

Can't argue with that logic!

Yup - was pretty sure I was going to build one anyway. Mostly interested in any 'gotchas' and experiences others have had. Can't exactly say I'm an 'experienced' builder, yet. TNC cables and copying the TTL/RS232 converter (PG-4S copy) for my V7A are as much as I've tackled so far.

Digi-Key has the XC5202 FPGA - about $10us + S&H. From where I sit, it's about as cheap to get the PCB and the chip. Mmm, may have to get a couple and stir some other local interest.

Always did want to teach the local bank something. Cutting an International draft for Euros may be just the deal!

>of some of the technical aspects of ringbuffers, interrupt handlers and
>handshaking.

The issue may be one of how the handshake lines
are implemented. As you state you can choke the
PK232 (or 900, 2232 or any other) by sending
uncontrolled data. The CTS line mus tbe tied to
seattle or something, sure not in the TNC to
anything usefull.

>(in the first versions it was very easy to crash the PK-232 by sending data
>and commands to it at a high rate)
>

There is a VERY simple way to fix this for the program
side.... The first is to feed commands in a controlled
method. For example send the command and wait
for the TNC to ack the respose. All AEA type tncs
will ack EVERY command sent. The next step
is to write a "tight" command parser that looks for
a SOH (ctrl-1) character at the wrong time (and compensate
for it). A timeout timer is also a VERY handy feature
especially if you liek the HPOLL command (not my favorite).

If you follow these rules, you can communicate with the
AEA controllers with zero (or almost zero) problems.

Right.

But nobody ever claimed that soundcards were the perfect solution
for 8 channels. SCC cards are. 8 TNCs and an 8-port RS232 card
certainly aren't.

I can read it but it is inconvenient because it asks for an extra
confirmation, and it keeps the encoded form in followups unless I
do extra steps.
(My newsreader, unlike Billies toys, does not automatically unpack
and execute MIME-encoded files and programs it finds on Usenet, you
know... I like that, so I won't change the default)

And for postings in American it is perfectly useless...

409. Internet Accessible AR-Cluster

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-29 00:00:00 UTC
From: nfivein@my-deja.com
Message-ID: <86vqdkllr1@nnrp1.deja.com>
Source record: 14403

You are welcome to connect to the internet accessible AR-Cluster at
KC0DJO in Duluth Minnesota.

The IP address is 209.32.226.63

At your first check in you will be asked for your Call, Name and QTH.
Please enter your QTH in the form: Chicago IL or Oslo Norway so that we
will know where all our new friends are from! You will also be
reminded to SET/LOCATION, that's optional but recommended. If you set
your location, then the AR-Cluster will calculate beam headings for you
to various prefixes. For HELP on these commands you may type

HELP SET/NAME
HELP SET/QTH
HELP SET/LOCATION

To see what you have entered type: SHOW/STATION your_call

You can correct any errors using the SET commands.

For more information on AR-Cluster including a Logon Tutorial and
Command List go to this website:

http://www.cestro.com/pcluster/index.shtml

Ideally you should use your logging program to make your telnet
connection. Its a huge advantage as then your logging program will
monitor the dx spots and alert you to contacts you need.

However, here are very simple instructions for using software already a
part of Win95/98:

First connect to your ISP as you normally do when using the internet.
Click Start then click Run.
In the box enter "telnet 209.32.226.63" (without the quotes of course).
Now click OK.

You should now be connected to the KC0DJO AR-Cluster.

Enter your call. If what you type does not display, then you will have
to turn on local echo. In the Telnet window click on Terminal /
Preferences.. and check Local Echo and then click on OK.

Now proceed as earlier described to sign on.

Try some common commands as:

SH/DX
SH/C

HELP

Welcome to the KC0DJO AR-Cluster.....and 73 de Ron N5IN

Sent via Deja.com http://www.deja.com/
Before you buy.

And if you have a way to make your own PCB, you can put it together
reasonably easily by buying the parts yourself. The Xilinx FPGA should
not be too hard to get hold of -- the catch is that many of the
distributors will have minimum order quantities or similar. Luckily,
here in Australia our local Xilinx distributor did not, so I picked
up a couple of these parts easily.

I built my own a year or two ago, although to be honest I haven't
really had a chance to use it yet. I did test it by connecting the audio
into the sound card and using the soundmodem on linux though.
Now I think I'll go out this afternoon and get the bits to connect it
to my new 70cm FM box.

You live in the eighties Hank. Doesn't surprise me, that is when you
wrote the package that made you famous. But the world has moved on.
Really.

>If that were *not* true, you (and the other complainers) would
>be able to provide answers. Give it your best shot.

I won't waste my time convincing you. Is impossible anyway.
That is already clearly shown by the questions you post when I propose
4 different solutions to the problem, geared at different segments of
users. You clearly think that any of the 4 solutions should be applicable
to both the home user and the 8-link node.

But fot the others: my last solution (SCC card with dumb modems) is a good
solution to the many-channels situation, and it already is for 10 years.
Hank ignorantly calls it "Internet TNC", clearly not having an idea what
it is. Like he is calling a YAM modem "KISS TNC". Haha.

I would not know anyone that dumb that he would suggest a stack of 8
TNC's as a solution to a situation where 8 9k6/19k2 links are tied
together. The two practical solutions are: PC with SCC cards totalling
8 ports (1..4 cards, depending on make and type), or a set of RMNC cards.

417. AGWPE with YAM modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-29 00:00:00 UTC
From: Hamish Moffatt <hamish@rising.com.au>
Message-ID: <86uegk$1f5l$1@arachne.labyrinth.net.au>
Source record: 14496
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc

I'm trying to get the AGWPE running with my YAM. It says
'AGWYAM driver not installed!' I unpacked drivers.zip into
my AGWPE directory (c:\ham\agwpe), there is agwyam.vxd in that
directory and the .mcs file.

What directory should I extract the vxd file into and how do
I 'install' it -- just unpack it? It doesn't work. :-(

The modem itself initialises fine with YAMINIT from the YAM web
site, so I don't think it's a hardware problem.

Appreciate any assistance with this...

thanks
Hamish VK3SB

Hamish,

Just a SWAG here - but in the Windoze 9x world an approach that seems to work now and again, is to put like files together. On my system the majority of VXD files reside in my C:\WINDOWS\SYSTEM directory. Try plopping the AGWYAM.VXD and .MCS(?) file there. See what happens.

Hey, if it doesn't help it's easy to undo!

Also, when you unzipped DRIVERS.ZIP - did you use the -d option ('Use Folder Names' in WinZip). Not sure if it's required - but is also a 'common miss'.

Good luck and eager to hear how you like your YAM

Source record: 14407

Jack et all:

No, it's not Timewave's mistake. It is a design flaw in which AEA and the orginal coder/owner of the program, Dick Litchel, did not take into account.

Keep in mind, in 1992 when PakRatt was first designed and written, no one was thinking of Y2K and by the time it became visible in 1997, AEA was in chapter 7.

Dick owned the source code to PakRatt and had licenced AEA to sell the program, as well as he did with Timewave when they aquired the AEA technology. Dick owned the source code until we (CSS) bought it from him in March, 1999.

By that time, Dick had added some features to it, but had not released the code, so the source we received wasn't direct 2.0 source. Since the source for 2.0 does not exist anymore, there was no way to make a binary equivalant of the 2.0 release code. This would be the only way to make a 'patch' for current 2.0 users. The same goes for the DOS versions.

The only option with the current source set was to make a new executable and dll's. And as you might guess, CSS didn't recieve any revenue from previous versions of the program, as well as we had to make the financial investment to purchase the source code to add the Y2K fixes in as well as adding a few more enhancments. We've also added many of the PakRatt features to Pacterm '98 and PkTerm '99, and have not charged anyone for upgrades on those products.

Hope this clears things up a bit.

Mike, if it'll run ssb it'll do packet. HF packet is done in AFSK, the transmitted audio is done in SSB. I'd venture all availaable HF radios will handle packet up to 4800 without dificulty. The older relay switched stuff may require TxD to be tweaked.

>How many of them run the left and right channels independently?

They don't have to, unless you need to sample at different rates
on the two channels. You shouldn't need to do that, so it isn't a
problem. The cards do need to be full duplex, however. Most
are, some aren't.

The more pressing problem is having enough processor HP
to handle multiple simultaneous streams of DSP. An old
486 or early Pentium isn't going to cut it with 4 stereo sound
cards to service.

SSB is what you use on HF. Speed is 1200 baud. How fast do you want
to go?

The Radio Shack 10 meter radio will do packet just fine. You can use FM
I guess, but that's not where packet activity is, and it wastes power,
electricity,
and your expendable income :-)

However, note that the maximum baud rate allowed for U.S. stations on HF is
1200 baud (10m) and 300 baud (12m-160m).

Is it correct behaviour though Roger - surely if CTS goes low, no more
output should take place of any kind, whether it is the UART buffers
flushing or not? Shouln't the UART handle this correctly, and why
does this only appear to happen under Windows?

It does seem curious.

Chris.

ICQ: 303779

HI MIKE
you should be able to use ANY 10 meter design mobile or base radio such
as the uniden 2510,2600, i have run packet on both these units with no
problems even the export 2950 that are out there will work we have
several guys that convert the old CB sets to function in the
28.080-28.200 area of the band.
packet is run on LSB other modes which include pactor,amtor,rtty,and
wefax(navtex)are also available on 10m
there are 2 data speeds you can use on 10 they are 1200 baud and 300
baud
stations not in the United states tend to use 1200 where most of the
domestic packet on hf is 300 baud
i hope this helps you some and good luck i might catch ya in there
someday

Often happens because someone fails to connect the appropriate
(CTS/RTS) pins on the RS-232 connector, or has a jumper set
incorrectly on the COM card disabling RTS/CTS flow control.

And of course it will happen with poorly written software ...

>does this only appear to happen under Windows?

>It does seem curious.

It does not work like that... the UART does not automatically stop output
when CTS is low. Some UARTs in computer history could do that, but the
function was usually riddled with problems. The UART used in the PC will
only present the status of the CTS input as a bit in a register, and will
optionally issue an interrupt when the status changes. The other UARTS
have this mode as well (and are usually operated in this mode).

The software needs to catch those interrupts, and twiddle its state to
not send more output to the UART when CTS state says it shouldn't.
But the bytes that were already put in the UART will still be sent out
to the line. The driver cannot reliably "cancel" bytes already written
to the UART.

Traditionally, this could be up to two bytes: one in the transmitter
shift register (the one currently being shifted out), the other in the
transmitter holding register (the next one to be clocked into the shift
register).
However, with the advent of FIFO buffers, there can be more bytes waiting
in the UART. The popular 16550A has a 16-byte FIFO, although it can be
configured to contain fewer bytes.

"It only happens under Windows" is probably a matter of slow reaction to
interrupts, that is a general problem with Windows. This was the reason
the FIFO UARTs were introduced in the first place: in the 486 days, when
a Windows machine had extreme trouble to reliably keep up with a UART
above 9600 bps when it had no FIFO, my Linux system happily did 57600
without ever losing a byte. To reliably receive data without loss, you
need to react to each interrupt quickly enough. Windows, because of the
frequent disabling of interrupts during long code fragements, doesn't.
This is probably because of switching between different CPU modes.

Transmit is less critical, but CTS handshake is, in a sense. When you
don't react on the CTS interrupt quickly, you would in theory be in the
position to send more data while the CTS line is low. However, the sending
of data is done in an interrupt handler as well, and one would need to
have a very stupidly designed driver for it to continue servicing transmit
interrupts while it is putting off service of CTS interrupts...
I don't know how this detail is handled in Windows, but I cannot believe
it would be implemented that way. On the other hand...

435. Re: Kantroncs bugs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-01-31 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <ZBkl4.218211$5r2.578029@tor-nn1.netcom.ca>
Source record: 14421

The original thread on the KANTRONICS bug seemed to die. For those who are only monitoring this thread, here is my message posted in the original thread on the KANTRONICS bug calling on HAMS to send EMAILS to Kantronics urging them to fix the bug.

Rob

I sent an EMAIL to KANTRONICS on the problem in their firmware and asked them to investigate and fix it. I also invited KANTRONICS to post a response on this newsgroup.

I just received an EMAIL back from KANTRONICS. Normally, I would not post an EMAIL. But KANTRONICS' response was totally non-responsive. KANTRONICS should have stated clearly whether or not the problem will be at least investigated.
KANTRONICS simply stated:

"This type of problem has been reported before, but only when using some terminal programs in windows, and only during file transfers at high speed"

That's it. Nothing more was said. The problem was reported before but did KANTRONICS ever investigate it??

I see this problem happening at 9600 baud which I don't consider "high speed". It happens with ALL the windows terminal programs that I have used (that do NOT use Hostmode). KANTRONICS appears to be blaming Windows and/or "some terminal programs".

It doesn't sound like KANTRONICS will do anything to fix this problem in its firmware for the KAM, KPC-3, etc

Perhaps, KANTRONICS will listen to public pressure. If enough of us complain to KANTRONICS, this problem may be investigated and might even be fixed in later firmware releases for the KAM, KPC-3, KPC-9612, etc.

Source record: 14422

HI,

I was told that some sound cards may be used to run packet (1200 or 9600). I had tried PC/Flex Net and AGWPE, but no one of these programs ran... Can I use a sound blaster 16 to run Packet???

Thanks,

73 de 14 AR 4782, Jean-Loup

Thank you. A most interesting analysis. Presumably, it would be wise
for a TNC (or any other serial device) to take CTS low well in advance
of running short of buffer space. Is that what most modems do?

Chris.

The other operators say they are on 28.195, and when I put
that in the window, and select USB, I can decode them, and when
I select LSB I can't :-)

Given a window freq, I can tell which one they are using.

Hank,

The CTS hardware handshaking does NOT work in the KANTRONICS KAM, KPC-3 and possibly other KANTRONICS TNC's even with expensive computer cables connecting all the right pins!

I agree that it shouldn't be hard for KANTRONICS to fix this type of bug. A lot of the code is probably very easy to find. Unfortunately, there isn't much political will.

Many Hams use a HOSTMODE program which constantly checks the amount of free space left in the TNC buffer. This approach has two advantages -- one can always send a command to the TNC since there is always some buffer space left in the TNC. Secondly, one can make sure the buffer will never get full and lose characters due to KANTRONICS' poorly written handshaking protocol firmware in their TNCs. Consequently, many HAMS don't ever see the bug.

But some of use like using the terminal mode!

Hey Simon,

At www.packetradio.com - the TNC to Computer section, you'll find the diagrams you're looking for.

I'm not familiar enough with Macs to tell you exactly which one is for you, but there's enough there you, at least, aughta be able to get real close.

Good luck!

Consider RTS/CTS vs. DSR/DTR vs. ^S/^Q.

Many different behaviors are possible, depending on how well the
terminal program is written, and whether it is configured to properly
deal with the connected device, and whether ALL the control lines
are connected, or some subset. HP published an exceptionally good
book on these topics.

The above only starts to scratch the surface.

However it is easy, as I've mentioned, to deal with this in the terminal
program, and most are able to handle the situation without any trouble.

As far as TNCs are concerned, at least the following have had this
problem, or other problems involving flow control:

GLB had "unsurmountable flow control problems".

TAPR TNC1 prior to firmware version 3.2.
(Both hardware and software flow control failed).

TAPR TNC2 prior to firmware version 1.3, and a few later releases.
(Various flaws or inconsistencies in both hardware and software flow
control.)

AEA PK-232, many firmware revisions.

Kantronics KAM, some early firmware.
Ditto the various KPC versions of the hardware.

Tereleader uTNC-21, only the beta firmware.

Heathkit - see equivalent hardware above. The 4040 tended to be
one rev behind the TAPR releases. The HK-21 used only the post-
beta uTNC-21 firmware.

Etc. etc.

Since this is ".digital.misc" and not ".tnc.misc" I should point out that
other modems in common use by hams also have these same problems,
or others that can produce similar symptoms in poorly written terminal

programs. Several of the HAL controllers were (and still may be) difficult
to program correctly wrt flow control. The PCI4000 and P38 are easy
to deal with, although they have exceptionally complex interfaces.

But this is a "terminal program" issue, nothing to do with the TNCs or
other controllers. They "do what they do", and the terminal program
must take account of whatever that might be. Ain't no harder than
BISYNC, UDLC, 2780/3790, etc. ad nauseum.

I use the US Air Force Method. The Window Frequency. Dial up
the frequency, and select LSB or USB. Forget about all the other
crap. Some people can take a bar of soap and write a Novel about
it, with 10 ways to scrub your ass. Just do it.

Rob Janssen wrote

Well said. Of course this isn't the first time Slimewave has stuck it to us. I'm still hanging on to my $439 paperweight called the DSP232, hoping they'll contact me someday to say they want to make it right. I figure the LEAST they could do is offer me the upgrade. As it stands they want to charge me MORE money to only partially fix a product that never worked as advertised.

They seem to want to disassociate themselves from the responsibility that they acquired during the AEA purchase. They're your friend only when things are working well, they never heard of you when you're having trouble. For example, they're all over this newsgroup talking about the latest relase of this or that, but have yet to respond to this particular thread.

On the other hand, I've found Rick and CSS to be very responsive to any problems that were mentioned here. I wouldn't hesitate to do business with them at all, unless of course it benefitted Timewaste.

For use with the D7, you need a 'plain' GPS.. The ones for the Palm feed directly to the PALM, and the data can't be funneled out to the D& very well

I have always just used a std mac din to RS-232 25 pin modem cable.
The modem cable grounds one leg of the Mac's RS-422 to make it RS-232.
You only need to make a cable for the TTL level GPS units that are not RS-232

Brian,
Connect via 2m packet to ancbbs (145.01) or (147.96). That is the main
packet hub for alaska and is there in Anchorage.
Might look for phone number of Doug Dickinson (kl7ikx) also.
Under web, look at: http://kl7aa.akconnect.com/ or
http://www.qsl.net/kl7air/

Good luck and 73!

Properly written code will twiddle the appropriate control lines
to make certain there is no possibility of buffer overrun due to UART
output buffering.. Code to handle this correctly is not difficult. It is
easy to allow for a "reasonable" number of characters to arrive after
the appropriate control line has been twiddled. Note that both ends
of the link must use the proper control line twiddling protocol, and
the cable connecting the two UARTS must have all the needed pins
connected. Most "bugs" of this nature seem to be due to cables with
missing wires, and not bad code in the sending or receiving device,
since that code is almost trivial to get right.

Close, no cigar. Read hostmode docs for how it really works.

> But some of use like using the terminal mode!

Then you might use terminal programs that are smart enough to avoid
this particular problem. It ain't hard ... even with Kantronics TNCs,
even without using host mode. I know, I've done it. Not a big deal.
Any terminal program that fails in this situation is brain dead.

Howdy, folks.

New site! http://cw.hfradio.org - CW / Morse Code Resrouce center. Lots of stuff coming down the line. If you have stories, tips, links, and other things, would you share them with me, and allow me to post them on this new resource?

Also, if you are into HF, consider getting onto 10 meters! It is hot right now. Lots of DX. The Ten Ten International club is challenging Amateurs to work 2000 contacts on 10 meters, any mode, any 10 meter frequency, in the year 2000. I've posted my current 10 meter logs on the site. See if you are in there (if ya worked me!).

As usual, you are also invited to visit http://hfradio.org - a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

>Given a window freq, I can tell which one they are using.

I think there has been a discussion before about what is the "correct"
frequency to specify for an FSK signal.

Could be:

- the mark frequency

- the space frequency

- the frequency halfway between mark and space

But apparently also:

- a frequency 1700 Hz below the halfway frequency between mark and space

... assuming that with "the frequency of the window" you mean the
frequency of the suppressed SSB carrier, and 1200 and 2200 Hz audio
tones being used to modulate the SSB transmitte.

Weird...

Thanks Richard!

Yes - it IS much easier ordering from someplace that will accept a credit card!

However - after looking at both sites (one you refer to and the YAM site),
doing the currency conversions at today's rates - it's worth the $22us for me
to order direct and find a bank that can cut a Euro check!

Do appreciate the idea though.

Thanks!

Hi there,

I was wondering if anyone could point me in the right direction for information about wiring a Kantronics KPC3-plus TNC to a Mac? The KPC documentation nicely describes how to connect to a PC with a traditional 25 or 9pin serial port, however, the Mac has mini-DIN 8 connectors for the printer/phone inputs and Im not really sure how these get wired up pin to pin.

Thanks in advance for any help!

Simon, AA9PW

Yes. And most other "RS232 serial devices with RTS/CTS handshake" as well.
Apparently the Kantronics TNCs don't.

A possible catch is that the number of bytes one has to have available
in the buffer when CTS is lowered has increased over time. But so has
the average size of memories, and hence of buffer spaces. So this should
not really be a problem, except when development has stood still over the
last 15 years. This may be the problem with TNC firmware.

I don't believe that. When the wiring is incorrect, the handshaking
will not work *at all*, and the uploading of a file via a 9600 baud
RS232 link into a 1200 baud packet radio connection will not result
in the loss of "a few bytes", but in the loss of nearly the complete
file after one buffer size. That is not the reported problem.

You may have interpreted the "euro cheque" to mean "a check in the Euro
currency", but in fact in Europe these checks have existed far longer than
the Euro currency, and are a completely different thing.

They are bank checks that can be used by customers in a number of European
countries, be written in the local currency of the country one wants to
make a payment in, and guaranteed by the bank up to a certain amount.
(the receiver of the check gets his money even when your account has
insufficient balance, unlike with the US check system)

They have been popular in Europe as a method of payment in shops and
restaurants, much like the credit card in the USA. However, they are
being phased out as electronic methods of payment (and credit cards)
have become more widely spread.

Ah yes - That does bring back a memory or two, that and remembering 'Konto'
numbers!

I'll re-check the YAM site and be sure I'm not missing something.

Thanks!

475. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8782mu$8fl$1@news.hawaii.edu>
Source record: 14361
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

Generally, for all HF, is it above (USB) or below (LSB) 10MHz?

THat is not true, Hank. With a 16550A with 16-byte output FIFO setting,
there is nothing your terminal program can do to avoid sending 17 more
characters after CTS is lowered, or at worst case 32 more characters when
a XOFF arrives, and ends up in the nearly-filled FIFO when only one
interrupt per FIFO load is taken. As it is customary to issue a receive
interrupt at 4 or 8 characters in the receive FIFO (especially with
Windows, where interrupt latency is a problem), the real-life number of
characters is a bit less than 32, but certainly 17.

This is a UART issue, not a terminal program issue. Your terminal program
can (via a system call) disable the FIFO, but that would defeat its
purpose.

This has *nothing* to do with sync modes.

What is "the window frequency"? The center frequency in the SSB filters?
That frequency indication hasn't been used in amateur radio equipment for
decades... it was used in the days of VFO-tuned USB/LSB/CW/AM rigs that
had a BFO that switched to -1500/+800/+1500 Hz.

Now, all (digital) amateur radio equipment indicates the frequency of the
suppressed carrier when SSB is used.

Like I said, it is a terminal program issue.

The use of the FIFO can be disabled, and any reasonable terminal
program (all the ones I use, for example) can deal with this.

The connected device "does what it does".

You need to deal with that, whether it is a requirement for software
flow control, the number of sync characters to be sent, whether local
or remote echo is to be used, and whether the UART FIFO should
be enabled, disabled, set to 8 char mode, and any other parameters
the connected device requires.

I've had *no* problems using any of the TNCs, as mentioned in a
previous message. Pretending the problem cannot be solved locally
is just a waste of time. Set up your terminal program to deal with
whatever the connected device needs, and stop whinging.

Won't even talk about reasonable ISR architecture ...

Like I keep saying: learn how to choose and use a terminal program.
Then you have no problems.

Think about the TNC1 (you *are* familiar with how it does flow
control, right?) RTS/CTS will not work with that device. So everyone
learned to set their terminal program correctly, or built strange serial
cables to allow the cross-over of the control signals. People do this
all the time, it's called "cleverness" or "ingenuity".

Same for the older KPC firmware, and *any* other connected
devices. They "do what they do". You deal with it.

What computer are you using with your D700A? We got ready to use one of our IBM z-50's and noticed that the data rate between radio and computer was held to 9600bps @ the radio and the z-50 com port cannot apparently be set lower than 19200. Don't think it's worth digging up a null modem adapter that the PakRattCE needs, if there is no chance for a correct connection speed.

I would'nt pay much attention to the Kantronics Bashing....I myself have used them for years and know several others who have as well without ever having difficulty. For the majority of users on basic 1200/9600 Packet...they are just fine...and you can also easily find one used. There is a KAM PLUS on rec.radio.swap right now in perfect condition, asking 100$.

Source record: 14373

There is nothing wrong with Kantronics TNC's, I have owned several and gotten good service out of all of them. They are competitive and arguably the best of the non-DSP units. For RTTY/Pactor I/G-TOR use you will be well served with a KAM PLus or KAM'98.

That having been said, at the high end not much else compares to DSP-based units like the SCS PTC-II or IIe. Throughput on Pactor II (proprietary mode supported by the SCS units and the virtual standard of most Pactor BBS systems) is nothing short of amazing given the limitations of an HF channel. But, to be fair the cost of these units is around 3x that of a used Kantronics TNC so this must be taken into account. For keyboard-to-keyboard chats the high throughput modes such as Pactor II or Clover are overkill, but for email/file transfers/etc. their performance is quite impressive. As usual, the value of the high-end units depends on your intended use, but performance-wise the difference is remarkable. For more information on Pactor II you can visit their web site at http://www.scs-ptc.com, a lot of information there, but pumping Pactor II of course.

Hope this helps,

- Seth N6BMB

Here's my vision-thing -- that the purpose of packet radio
is to build community. And that the technology is both
a means to facilitate communication, and a gatekeeper to
hold back the 'riff-raff.'

I mean, if you question, what is the purpose of 1.2Ghz
EME, I'd give the same answer. The real answer lies
in what kind of people use that mode, and are those
the kind of humans you want to hang out with?

I would say that to the extent you're insterested in developing
or even using 'weird technology' -- well, that's part
of it too. Obviously the specifics, and perhaps the 'rules'
are a matter for some debate. But at the bottom of it,
is always, 'what kind of 'interesting' techology can
we use to communicate' and 'are the other people doing
this the kind of people I want to hang out with.'

490. CRC16

Date: 2000-02-03 00:00:00 UTC
From: Guy BACH <bach@hrnet.fr>
Message-ID: <87blrq$9mt$1@jaydee.iway.fr>
Source record: 14376

Hi,

I'm looking for a implementation example (in C or Pascal) of a CRC16
algorythm.

I wrote one but I would test it with another because I'm not sure if there
isn't any error.

The polynome that I used is:

x16 + x12 + x5 + 1

Thanks for all

Eric PERRIN

I might want to use "non-suppressed carrier" AM or FM mode.

Search the internet for the following files:

skyv1_4b.exe
sky1_5up.exe

Last time I looked, they could be found at
http://oak.oakland.edu/pub/hamradio/arrl/bbs/tcpip/

These files are shareware and look and operate identical to the software
sold for the MFJ1278b by MFJ.
The program name is Skyrider.

Hi!

Have a look at http://www.liebeck.de/70_breit/76k8eng.htm

You can get kits at http://www.giga-tech.de (although they seem to be
quite slow in response sometime and they speak German):
http://www.giga-tech.de/bausätze.htm.

There is also a complete TRX available, great, but very expensive:
http://www.symek.com/tnc-g/trx4s.htm

You can get the modems (EPPFLEX) required from http://www.baycom.de.

Yes, we found the menu change about 4:30 this morning (software dev. is great fun) and will now proceed with more testing after locating a null modem adapter (RS is out of stock, but found a long one at a local PC store). Hadn't looked at the larger manual, just the specialized comm. one; and Chris pointed out the menu change this morning also. Thanks again. What computer are you using with the D700?

I would RTFM if there were more hours in a day!! Besides, after all of the 'cup holder type support questions' we field; I suppose we're allowed one too.

Apparently there is a lot less stuff available on the US market than over
here in Europe. We can buy assembled SCC cards, accompanying modems,
SCC cards with modems on them, separate modems connected to serial or
parallel port, etc. And soundcards, of course.

In the past there was a company named DRSI that sold such things in the US,
but apparently the US amateur prefers a hot and noisy box over a PC card.
(this was in the days of the AEA PK-87 and PK-88, aka "the furnace")

These are all to be preferred over any TNC.

I would hope so, yes... at 9600, it would perform terribly on satellite!

(satellites send a continuous 9600 bps HDLC stream. at 9600 baud ASYNC,
you would lose 20% of the data, especially when the buffer handling is
poor and it cannot buffer a few KB to send during short fading periods)

498. DSP-232 Special Offer from Timewave

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-03 00:00:00 UTC
From: jdouglas@timewave.com
Message-ID: <87cs2l$ao5$1@newsfeed.minn.net>
Source record: 14384

Timewave Technology announces a special offer for DSP-232 owners

Timewave has announced a trade-in offer for owners of the original DSP-232 Multi-Mode Data Controllers purchased from AEA. This plan allows those owners to trade-in their DSP-232s for the PK-232/DSP Multi-Mode Controller currently in production.

This offer allows you $175 off the price of the PK-232/DSP (with software) bundled package when you return your DSP-232. For those that have upgraded their DSP-232 with firmware or software from Timewave there is an additional $25 savings.

DSP-232 Multi-Mode Controllers purchased from Timewave under the closeout offer are not eligible for this program. This offer is subject to the availability of new PK-232/DSP and may be withdrawn or changed at any time.

To take advantage of this trade-in offer obtain an RMA from Timewave by phone or email. Then send your DSP-232, with a copy of the original sales receipt and $325 and receive a new PK-232/DSP with PK TERM 99 software; that is a $500 value ($499.95 MSRP). If you have purchased the DSP-232 upgrade, PC PakRATT 32.1 for Windows, or PK TERM 99 include that receipt and save another $25 off the $325 price.

PC PakRATT for Windows software is also available in the package instead of PK TERM '99, Just specify PK232/DSP with PC PakRATT for Windows if you need Windows 3.1 software.

If you choose to keep your DSP-232, Timewave is continuing to work on the firmware problems in your DSP-232 and if any of the remaining DSP-232 problems can be rectified those upgrades will be announced as they occur.

See http://www.timewave.com for further details.

I suppose so, but "I'm too busy to read the manual" is about the worst excuse
in the book. It's like saying "We don't have time to stop for gas" when
driving somewhere.

Hellp
I'm a newbie in the digital ham world but I was wondering if it was
possible to use 14400 bps modulation on a low end RTX ?
the audio bandwith is quite narrow but for instance
I had no major problems with decoding packet @ 9600 bps FSK
with my soundcard in FM mode (my TRX is a HR2510).

But today's CPUs are so powerful that i thought that
it was possible designing some more complex modulation mode
than AFSK that is 25 years old... (maybe more ?) QRM resistant
and that would be suitable for low end RTX... and fast...14.4

PS: The SC chipsets now sample up to 48000... but maybe it's not
sufficent for modes > 9600 ?
So, do you know some SC brands that sample at an higher rate?

Cathryn,
I recently started playing with packet to begin learning how to use it. I have a Kenwood TH D7a and a Palm Pilot 3E. I use the Palm Pilot at the computer hooked directly to the radio. You will need to download a VT100 type terminal program for it(Palm Pilot) and you will need either a modem cable which is now difficult to get or a serial cable with a null modem connector to fit between the serial cable and the cable that came with the PG 4W cable and software package from Kenwood. I have tried a very nice shareware program from www.markspace.com called Online for the VT100 software. Also be very careful which GPS unit you get. Some of them won't work with the TH D7A. The output needs to be in the NMEA format. You can search the web for a web site that will tell you which GPS units that are compatable. If you have anymore questions get back to me.

Tom

Yes, but if you really 'scour' the manual; you find on page 4 of the
Specialized Comm. Manual "Note: You must not change the default (9600 bps)
in Menu 1-9-5 (COM PORT)." Emailed Kenwood; film at eleven!

All I do is run my TS-940S in SSB mode and just crank down on the slope tune knobs. The resultant selectivity is more than enough and I let the software do the rest. If there is too much tightening, I can kill off the signal with no problem. Weak signal contacts have been excellent with the radio in SSB mode.

73,

Richard, N6NKO/9

Brian,
Connect via 2m packet to ancbbs (145.01) or (147.96). That is the main
packet hub for alaska and is there in Anchorage.
Might look for phone number of Doug Dickinson (kl7ikx) also.
Under web, look at: http://kl7aa.akconnect.com/ or
http://www.qsl.net/kl7air/

Good luck and 73!

70cm:
For low speed packet (9k6/19k2) the best option is the t7f:
http://www.baycom.org/bayweb/tech/t7f/index.htm
kits are available from the author, complete transceivers
from www.kombi-elektonik.de (perhaps from others, too).

Before the t7f was available we used TEKK-radios (known as
KNET here)

High-Speed (76k8):

http://www.liebeck.de/70_breit/76k8eng.htm
Available as kit from www.gigatech.de but not as assembled
unit. This one is used by all of the few 76k8 user access points
as far as I know.

Another option is the rather expensive trx4s from symek. I
don't know anybody who actually use it, so I can't comment
on it, but it sounds all very nice (besides the price)

http://www.symek.com/tnc-g/trx4s.htm

On higher frequencies such as 5/10Ghz there are no
commercial radios available. For 6cm DF9ICs GigaTRX
is the standard, on 10Ghz some people use modified
commercial TV-satellite equipment (which is rather cheap).

73s Hans-Peter

PS: I am not a HF specialist, I can only tell you what is
available if other people build it ;)

If I might make a comment here.

When I first got started in packet (late-comer in 1989) the BBS and chat was the main focus. There was pretty good netrom coverage in Oklahoma and Texas, as well as Kansas.

It seemed to me that everything was going pretty good, but there was no focus
for where it was supposed to go. The node custodians started finding other things to do, and slowly they went away. The BBS still seemed to continue without the nodes, but rather quickly the users went away. It seems that everyone sold their packet stuff and got out of it. (I'm talking locally here,
and other areas may have had totally different scenarios).

My comment is, what is packet radio supposed to do? Of course it provides a method of exchanging messages, or even providing a data channel for remote control, but what is the big picture?

I know that TAPR is going to release their Spread Spectrum radio in a few years, and Hams will have high-speed low-power radios to network with, but what is this network supposed to do? What is it that needs a data network, that Hams can provide? Other than just the thrill of building something electronic, and seeing it work?

I guess my question is, among the digital crowd, what solution do you need that an amateur radio will solve?

Steve, K5OKC

Message-ID: <s9q0tonk98e137@corp.supernews.com>
Source record: 14256

I used to meet with several Hams every week, and we discussed
packet and other Ham stuff over a pizza. Some of us were into the
software, some into the hardware. Mostly we just had fun with the
mode. Most of those guys have passed away, and I don't see anyone
on the band who wants to experiment. Mostly it's just DX Cluster
and APRS. So, I look at the wide-band radios and say that's pretty
neat, but say I bought 4 of them, I bet I couldn't find 3 people who
would set one up and form a network to experiment with them.

I have been messing around with Part-15 stuff lately, and it's hard to
find others willing to experiment with long range Spread Spectrum.
While the cards are cheap for in the home, the price goes up rather
quickly as you move to the roof. People who are used to paying
$400 for a 5 Watt talkie, just won't spend that much for a 100 mW
1.6 Mbps network. Plus the microwaves are a little more difficult to
aim, as there are no repeaters as such. Since I've set up a 4 1/2 mile
link, I have been asked a lot about my system from commercial
entities, but Hams so far have just circled their fingers around their
ears when I describe it :-) But the throughput is very exciting when
compared to FSK modes. Heck it's more exciting than my ISDN
throughput! I'm about the same speed as a cable modem, and
the annual fee ($500 a year) will set you up for about 4 miles range
at 100 mW (into a 21 dB gain parabolic). But there is just no
interest in networking for any other purpose than web browsing on
the internet it seems... I should be able to take this knowledge to
Part-97 Ham when Spread Spectrum modems begin to appear, but
we're still a few years off.

Just a few comments, I'm not trying to start anything :-)

If Dutch is no problem : http://www.dse.nl/ws19/nokia.html
Here you can buy an scc card (only 1 scc chip) for US$ 25 and a 9k6 modem
for US$50, and a Nokia cellular set suited for modification to 70cm 9k6
also for US$50.

Getting all this stuff shipped to the USA is quite a hassle - i'm sure
similar projects are running over there ? We have literally truckloads
of UHF cellular equipment to our disposal due to the demise of analog
cellular networks.

There is very little happening here. The move to the internet pretty much
stalled all work on digital networks. I'm looking to get some new projects
off the ground, and have been studying what has been developed in Europe.

There does appear to be some very interesting gear, but the prices are
a bit high. That is better than the situation here, where there is little gear
available at any price. Have bought various things from European shops,
from many different countries, without too much hassle, so suspect it is
not a big deal any more. Before credit cards (like back in the 1950's)
it was quite a bother getting funds transfered, doing the currency exchange,
etc. etc. Now it is usually pretty easy. Maybe the Europeans can do a
bit more advertising targeted to the US market (smile).

I would be interested in networking along these lines with some
local folks, but that's one of the problems...we may live in separate
areas that make this unfeasable.

I have been experimenting with HamWeb, and it works well. I have
a 10BaseT network at home with an ISDN router as a default gateway;
this allows Internet access without the hassle and user intervention
of a dialup connection.

I live about 250 yards from a lake, and have been going out there
to test Internet accessibility via HamWeb and my LAN. Works like
a charm so far. But this is omnidirectional 70cm access, and after
a few miles the effectiveness wears off. Microwave would be fun
to experiment with; however, by nature this is a point to point
technology; I would like something with a broader coverage.

I don't want to "browse" the Internet while away, but it certainly
would be handy to have wireless Internet access at times.

I find your experimentation interesting, and would be interested in
working/talking/experimenting with folks with similar interests in
Dallas, or actually folks anywhere if it makes sense.

Some folks at l0pht (http://www.l0pht.com) were experimenting
with 2m or 70cm LAN links, but I don't know the outcome, plus
I think we live 1500 miles apart.

Anyway, good luck, and maybe something cohesive will come about
soon (and hopefully affordable!)

I am experiencing some telephone rfi when I operate PSK31 on 40 meters.
I do not have this problem on any other band, and not with any other
mode on 40 meters. Just on 40 meters and PSK31. Does anyone out there
have an idea of what may be causing this?

I'm still desperately searching for a ruggedised portable PC, capable of running
Windows CE, if anyone has such a thing, or knows where one can be found secondhand.

The ideal is one of the very rugged models made by Husky. The laptop made by Panasonic in a rugged case might be a possibility, but I could really do with the full weather protection of the Husky.

Any ideas, anyone?

Date: 2000-02-07 00:00:00 UTC
From: Lee Smith <ckvnfm@mb.sympatico.ca>
Message-ID: <A8xn4.2378$lf7.55878@news1.mts.net>
Source record: 14267

Hello Folks:

I have been lucky enough to have the loan of a HAL DXp-38 and have been using various modes with good results on the TS-870.

That has kindled my interest in getting my code back under control, but I have been a way for a long time and am worse than rusty!

I would like to play around with CW via the sound card so I can at least watch some QSO's, and listen at the same time to get myself comfortable again.....sort of like having my Elmer riding shotgun for me when I made my earliest QSO's in the old days.

Can you recommend any free or inexpensive CW software that works well in your experience?

Regards to all,
Lee Smith

532. Internet Accessible AR-Cluster

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-07 00:00:00 UTC
From: Ron <no-spam@no-spam.com>
Message-ID: <i9Bn4.424$Pd1.31982@news7.onvoy.net>
Source record: 14268

You are welcome to connect to the internet accessible AR-Cluster at KC0DJO
in Duluth Minnesota.

The IP address is 209.32.226.63

At your first check in you will be asked for your Call, Name and QTH. Please
enter your QTH in the form: Chicago IL or Oslo Norway so that we will know
where all our new friends are from! You will also be
reminded to SET/LOCATION, that's optional but recommended. If you set your
location, then the AR-Cluster will calculate beam headings for you to
various prefixes. For HELP on these commands you may type

HELP SET/NAME
HELP SET/QTH
HELP SET/LOCATION

To see what you have entered type: SHOW/STATION your_call

You can correct any errors using the SET commands.

For more information on AR-Cluster including a Logon Tutorial and Command
List go to this website:

http://www.cestro.com/pcluster/index.shtml

Ideally you should use your logging program to make your telnet
connection. Its a huge advantage as then your logging program will monitor
the dx spots and alert you to contacts you need.

However, here are very simple instructions for using software already a part
of Win95/98:

First connect to your ISP as you normally do when using the internet. Click
Start then click Run.
In the box enter "telnet 209.32.226.63" (without the quotes of course). Now
click OK.

You should now be connected to the KC0DJO AR-Cluster.

Enter your call. If what you type does not display, then you will have to
turn on local echo. In the Telnet window click on Terminal /
Preferences.. and check Local Echo and then click on OK.

Now proceed as earlier described to sign on.

Try some common commands as:

SH/DX
SH/C

HELP

Welcome to the KC0DJO AR-Cluster.....and 73 de Ron N5IN

Warning! The Kenwood TM-2570A is a notorious N-ray emitter. Prolonged exposure to radiation from the Kenwood TM-2570A can result in convulsions, coma, and/or death. The Kenwood TM-2570A was an attempt to harness newly "discovered" technology dating from around 1947 in a eye-catching, ergonomic design that could replace traditional Class A amplifiers. The promise of this device was to combine over-unity efficiency with a linear amplification curve. Unfortunately, many early users of the Kenwood TM-2570A simply vanished before they could assess its real-world performance.

There are representatives of several well-known nations who could give you a good price for it. Please be very careful with the Kenwood TM-2570A, Jerry.

Hope this helps.

Corry

541. PK232 with Harris RF 3200

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-08 00:00:00 UTC
From: Roger Basford <Roger@g3vkm.demon.co.uk>
Message-ID: <ug1+NDA2FHo4EwOX@g3vkm.demon.co.uk>
Source record: 14277

Hi,

I am trying use a PK232 multi-mode TNC with a Harris RF 3200 transceiver, without much success. I can key the rig and get audio from the RX into the TNC but there doesn't seem to be enough AF out of the TNC to drive the rig to more than a few watts output. This has not been a problem on the various amateur rigs I've owned. With soundcard programs everything is fine, as of course there is AF output from the card to spare. Has anyone else come across this? Perhaps an add-on buffer amplifier is all that's required?

I don't have a technical manual for the Harris, only the operating and programming manuals so I'm unaware if there any internal level controls that could be tweaked. I've seen the same problem with two RF 3200s and so it's unlikely to be a rig fault. I'm connecting to the transceiver via the 15 way service connector on the rear panel but the effect is the same via the mic socket.

Any feedback appreciated,

Roger, G3VKM

543. How do I receive CW on my KAM98?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-09 00:00:00 UTC
From: Dave Covert <davecove@thecoverts.com>
Message-ID: <42142E1C82520F8E.2E0CC2EED4C97A05.2C4777DAC6223FC7@lp.airnews.net>
Source record: 14279

I know what the directions say... while at the command prompt, type CW and press return. But then what?

Before I type CW, I find a strong cw signal and tune it so as to get maximum jiggles in the lights on the front of the KAM98. As soon as I type 'CW<enter>' the light goes to the far left and stays there. No amount of tuning will make it move.

I have never seen any text come from that strong CW signal.

I have tried setting the speed to 5, 10, 15 and 20. I have tried <ctl C>U and set CWBAND to 1000. Still nothing....

What am I missing?

Dave KB5GOG

Check your MARK/SPACE in the TNC software/firmware shift maybe be shifting
??aslo if it is similar to my SCS PTC2 you will have to tune the CW sig in
SSB and have LED on the left hand side Fully light inbetween Dits and it
will jump to the RIGHT when tnc hears the CW tone,then tune very slowly
till characters appear on screen
not sure,don't own a KAM ,but what you describe is similar to PTC2,

Hello all,

I hope that this message is not a problem being commercial in nature.

I work for a small electronic engineering firm and we have decided
to enter the ham radio market as a new cottage industry company, in
support of our hobby. We would like to announce a new product for
the digital modes. We are just about finished with our production
prototype testing and expect to be in production in about 6 weeks.

Please see our web page: http://www.westmountainradio.com

We would like feedback from this group, we are not ready to take
orders, we are simply asking for your feedback.

Thanks in advance.

Try browsing around the Mac Software at URL:
http://www.ac6v.com/pageap.html#MAC

John, WD1V is one of the Ham Mac gurus -- maybe E-Mail him after browsing.

What is its principle of operation? For $80, I doubt it is DSP-based and anything except a DSP-based design is obsolete. Is this just another analog FSK modem? Is this just another level detector design?

Cecil, did you look at the web page ? :-) This
thing looks to be a pretty nice sound card to rig
interface with audio isolation transformers,
serial port to PTT control, mike/sound card
selector switch, etc. It's not a decoder - just an
audio and PTT interface.

Bob, for $80 it should do more than I can do in my sleep.
An audio and PTT interface costs only $5 using brand-new
parts. I can put together a couple of dozen or so such
devices from free parts in my junk box.

Cecil--

The DSP is in the soundcard you interface the device to.
(I always though it was a Good Thing to be able to have
paid for hardware do double or triple duty...)

For $80, you get a device that makes rig to souncard and PC
comm port connections a breeze, and you can leave it inline
during voice operation. Sign me up!

As far as any 'netnews guidelines' (you mean UseNet?), I
think roughly half the activity in here in in major violation
of any guidelines!

I, for one, welcome a commercial post from someone who is
marketing good ideas in HAM hardware. His post was not
SPAM, and was constructive IMHO. Many posts in here
are anything _but_ constructive, and they are allowed...

I would probably try a hard reset. If that doesn't do it, you MAY have
a shorted PTT transistor on the HF side.

Cecil, no doubt you can build an interface for a
few bucks that will work just fine but I'll bet
you can't buy the case that thing is in for $5.00.
MFJ is selling a voice/digital switch for $39.95
and it has no serial/PTT interface or isolation
transformers. Like you, I'd personally build my
own but I think $80 is within reason if you want
to purchase something already built and ready to
go.

559. Re: NEW HARDWARE FOR DIGITAL MODES!

Source record: 14295

I also think the $ 80 is also on the high side for what the interface box does. That said, for the hams that will not take the time to learn how to build simple circuits , let them pay the price. While the building of transceivers and such are way too much for almost all hams, they should learn to build the simple things or pay the price. Hams should have some soldering equipment and also a SWR bridge of some kind. Just hacks me off they can not put up an antenna and check it out. I mean really look at the price of some of the wire dipoles and G5RV type antennas.

About 20 years ago I could not afford a ST-6 so I built one from the plans in a ham radio magazine. Could not afford to buy a computer at that time either so I pieced together some junk at the hamfests and found an old 8080 computer board with about 1 k of ram and 2 K of eprom with a monitor program in it. Had to teach myself how to program in hex and write a rtty program. Took aobut a year to do all that. Just too much of the NOW generation. Everyone just wants to put down the cash and get it now.. I am sometimes guilty of that myself now.

People with junk boxes like yours have been keeling over rather
exponentially now. Rather than saving all their money for beer and
cigarettes, they spend it on mass produced parts, eat salad,
talk with their family, jog, and drool over Algore's latest tax and
spend vision...

Then you should go ahead and do just that. But there always is
a market for selling $5 in components as a $80 ready-made appliance
with instruction manual and (0/1)-800 number to help the absolute
dummy to get going...

Hi Simon,

Try:
http://www.cssincorp.com/pakrattce

This is a nice Windows CE packet program that will run just about any TNC (No Baycom). Another site to check is:
http://www.tapr.org

This is the packet capitol and they have various packet related programs and info. A Windows CE version of APRS is coming out soon & this is the site where it should be available. Good luck & 73's.

Cheers.
Ralph NH6QT/3

564. RAKE what is it?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-10 00:00:00 UTC
From: Robbie <natural@tpgi.com.au>
Message-ID: <38A2053B.92A240B2@tpgi.com.au>
Source record: 14300

Can anyone tell me more about RAKE. All I know is that it is used in digital radios which uses a multipath combining scheme to elminate multipath losses.

565. Problem with D700A - am I missing something?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-10 00:00:00 UTC
From: Tim Goldenburg <tim@goldenburg.com>
Message-ID: <uypo4.366$6V4.30316@typhoon.austin.rr.com>
Source record: 14301

I'm new to amateur radio. In fact, I haven't received my call sign yet. I'm hoping by the end of this week. I recently bought a Kenwood TM-D700A as my first radio. I bought it so I could experience packet radio. I liked the built-in TNC feature. Hopefully, I am missing something simple, or someone else with this rather new radio can elighten me.

I'm using a DB9 female-female laplink (null-modem) cable.

The instruction say I need
9600 bps
8bit
1 stop bit
no parity
hardware flow control

And then starting TNC PKT mode.

I've done this on 2 com ports which I know work. I've also tried 2 com ports on a separate computer. I can't get my computer to talk to the radio. I've verified that the ports are set (through device manager in Win 98) at the above settings. I am trying to communicate through Hyperterminal to no avail. I've double checked the radio setting that it is receiving data from the computer at 9600 bps (which is also the default).

For fun, I've tried
9600
7
1
even
hardware

9600
7
1
no
hardware

and those settings with xon/xoff flow controll.

I have also tried to use the beta software from kenwood to program the radio. I can't get this software to speak either. Any ideas? Could it be a bad port on the radio?

Thanks.

You do not want a null modem cable - you need a double female straight through cable and if you are using the Kenwood program, I found that it ONLY works on COM1, not on COM2.

The cable I have is a

Belkin 10' Direct Cable Connection
PC to PC File Transfer
DB9 Female/Female
Serial

Is this not the right cable? Perhaps I misnamed it calling it a null modem cable. It looks similar to the null modem cable that came with laplink.

It appears to be a straight through DB9 female <-> DB9 female cable. The pin numbers are the same on both ends. I don't see why this wouldn't work.

The pin-outs on the cable are (it's actually printed on the cable)

5 4 3 2 1
* * * * *
9 8 7 6
* * * *

Both ends are the same. This verifies that it's a straight through cable.

The pin numbers are based on physical location of the pin inside the connector
shell, they have nothing to do with the electrical connection of the pins.
It sounds like you have a cable intended to connect one PC serial to another
PC serial port for the sake of file transfer, in which case I strongly suspect
there are some wires crossed over inside the cable, not "straight through".

That sounds like exactly the problem. I just checked www.pin-outs.com and
you are correct. Pins, 2-3, 4-6, 7-8 are reversed. I won't have time to
stop by my local Altex since it's on the other side of town. I think I'll
run by CompUSA and purchase a DB25 male-male straight through (which I know
they sell) and some db25-db9 connectors.

Thanks.

>multipath losses.
>
I can't tell you anything up-to-date, but back in the 1950s there was
a project at MIT on receiving HF through multipath propagation. They came
up with RAKE, in which they put the incoming signals through a delay line
with many taps and selected the taps so that they got signals which could
be added up to recover what was transmitted by combining the signals
coming through different paths. This was in, I think, Proceedings of the
I.R.E. and I'm not in the library right now so can't tell you when it was.
In those days it took many racks of equipment.

Just recently I was at a lecture on portable telephones of the future and
the speaker mentioned that with the microwave and near-microwave frequencies
they use, and operating in the urban environment with tall buildings,
they get lots of multipath and use RAKE technology to overcome it. So
I had some idea of what he was talking about. He mentioned RAKE "fingers"
and I take that to be the number of different multipath copies of the
signal they can handle and combine. I guess with modern electronics it
all goes on a chip with room left over.

C'mon, be reasonable, Cecil. Those $5 in components aren't the same
as the $80 product (which seems to be priced a little high, IMHO). This
is not about a technical hobby, it is about reliability and aesthetics. If that
$80 device is well-made, reliable and looks good, then it is probably a
better deal for a lot of people that would rather operate a radio than
tinker with hardware.

Sure, I made a cable to connect a computer sound-card to my FT-847
for about $5, and I even put the PTT-keying transistor inside a DB-25 shell,
so it all looks rather sanitary. I used a molded cable assembly as the basis
of the cable, so maybe I'm not technical :-)

Feb 20th is the anniversary of the beginning of FSK RTTY on the ham bands.
It all started on Feb 20, 1953 when the FCC set that date for making FSK
legal, and required 60 WPM Baudot with 850 Hz shift for RTTY on the HF ham
bands. Every year we celebrate this event and remember the RTTY pioneers
with Green Key Night (& Day) on Feb 20. It's not a contest, although
The New RTTY Journal is offering some awards anyway - see the December
issue. The guidelines are
Use a mechanical teleprinter if you can (but you don't have to)
Use vacuum tube gear if you can (but you don't have to)
Operate some 850 Hz shift if you can (but you don't have to)
Get on the air and have fun and wallow in nostalgia and remember
the pioneers of RTTY who worked so hard to make this mode possible.

What I would try, is take a continuity tester, or even a
battery and a couple of wires, and check to make sure that
every pin x, comes out at pin x at the other side. I would guess
that pins 2 and 3 cross over.

You should be able to get another identical cable and a gender
changer and hook them all together, and it should work, if
this is all the crossover that exists..

A Real Ham would have a cigarette lighter in there, and it would be big enough to put your beer can on as a coaster.

Hello all!

I don't know the attitude or personality of this group but I hope it
is more amateur radio than computers.

I got notified by one of the groups "internet police" but I have been
reading the comments and they have been helpful.

Looks like we should come out with a $5.00 version, we could throw an
isolation transformer and some resistors in a envelope. Of course that
version you would have to cut your microphone off the cord and solder
the parts in between and hook up your sound card. You couldn't talk
on your radio anymore but your computer's audio would be hooked up.
Just kidding.......hi,hi.

We could make a RIGblaster BASIC with just a PCB and all the parts
for ground isolation and serial PTT control; but no cables, box
or connectors. It would probably sell for $12 in kit form and we
will probably make one.

The ham community seems to be spending more time talking about and using computers than radios, something I am not happy about. My boss N1ZZ and I thought it might be good to make a product that connects them together. Since parts are hard to get and most hams can't solder anymore we thought it should be easy to hook up and universal.

The RIGblaster took 3 man months to design and get to market an it has more than 60 parts. The parts include 2 high grade mini toggle switches, 2 DPDT relays, 9 connectors, 1 optoisolator, a painted and silkscreened .062" aluminum case, a 12 volt wall supply, a double sided plated through, FR4 board, a CD with most of the sound card software downloads and info, not to mention US assembly time packing and QST advertizing....the list goes on. It wasn't designed to be cheap but it is supposed to be high quality and convienent.

I just got the web page up and I haven't had time to put a technical description or product detail on the page yet.

I hope that it gets more people on the air with their computers.

If you won't post the schematic some specs would be nice. Input impedance, isolation methods and ratings, distortion, level control, output/short circuit protection etc.

FYI, you have picked a hopelessly dead market. While there are a few exceptions MOST packet types would never spend $80 to connect their $1200 computer to their $1300 radio.

I dunno about the $5 model but a kit form would be nice.

I made my cable by removing the male end of a
serial cable and soldering on another female db-9.
I wired it straigh thru pin 1 to pin 1 and so
forth.
To make the Kenwood software work, I had to turn
the radio on after the computer was in the
Kenwood control program. Then the computer
seemed to "find" the radio.

For old stuff like this, take a look at:

ftp://ftp.ucsd.edu/hamradio/packet

Then root around, as everything about the TNC-2 is in there somewhere.

Hmmm .... I wonder which TNC this is ? I had the same problem with a TNC-2
clone and fitted a JKISS eprom, the image of which can be found in the
G8BPQ node packages at least 4.06 through 4.08a - that fixed it for good.

Thanks for everyones help. I have now blown one jkiss eprom and one
TAPR tnc1.1.8a with kiss set on. They will both be tried. I am
running the 1.1.8a at present, if that gives any problems will try the
jkiss eprom, If all is well will send them over to gb7flk.
Thanks
Richard

That is probably where I got it from... but it has been on my disk(s)
for over 10 years, so I don't remember the details. I used it for a short
while: just after I discovered TCP/IP and before I discovered that KISS
TNCs are not a desirable thing. Then I built my first SCC interface card.

The guys at Kenwood have no idea about standards. But we already knew
that... when the pins are not wired in totally nonstandard ways (when it
is a male plug it should be wired like a DTE guys! That would mean a
female-female cable would be wired as a null-modem to connect the device to
another DTE,like a PC!), they are named in nonstandard ways.
(like calling the PTT line "standby for data" or naming the line on which
it receives data "transmit data")

Exactly what standard are you referring to?

The RS-232C standard did not even specify the 25 pin D connector and thus did not mention anything about the connector sex for DTE/DCE, it only specifies the operation of various circuits. This may have changed with newer revisions of the standard, but I very much doubt that in practice much has changed.

In practice "RS-232 compatible" means that the device has communicated with at least one other device declared as RS-232 compatible :-). Very few devices implement the RS-232 standard to the letter. This remark is not intended as a defence for Kenwood, but only tells about the practice in industry.

I think PacComm in the U.S. still sells adapter boards for the TNC-2
which plugs in to the modem header. They would be assembled though.

If this is for home use, you might look into Linux with a sound card.

Most of the stuff you'll see on Packet is DXCluster and APRS.. The good news for you is that Pacterm '98's demo mode lets you run mutlistream packet, with no charge for it.

To see what firmware you have, do a VER at the cmd: prompt. The last digits are the firmware revision.

Source record: 14202

I've got a Ten Tec RX-320 PC based SW receiver that delivers its audio to the line-in on my sound card and it works great. I downloaded TrueTTY (a RTTY/PSK31) program that takes the audio from the line in and decodes it on the screen. It doesn't appear that I'm getting any audio feed. There's mention in the program help file that the sound card should support 'Mono 16 bits 11025 Hz' Mode. I suspect it's the sound card on the backup system here (Zoltrix 3D) but wonder if anyone else has had any experience with the program and if so what soundcard was used ?

Regards

Gary

Hello Donald,

Many of the BBSs use HF packet for forwarding traffic between themselves. They
ID at 300 baud (required by law) but use data compaction to move the traffic
faster. I suspect that is what you are hearing.

>Exactly what standard are you referring to?

The standard of wiring an RS-232C interface on a D connector.
I don't know its name or number, but it has been used by countless
manufacturers of computing equipment.

Normal practice: when it fits, it works. Or at least as far as the
signal directions are considered.

When you introduce a gender changer: it does not normally work. When
the gender is incorrect, a null-modem needs to be inserted.

A few manufacturers have produced terminals with female connectors,
but IBM did not make this error on their PC line, so the clone manufactures
didn't either.

Howard,

Since CSS owns the PakRatt source code, you might want to look at our Pacterm '98 product. You can download the demo at http://www.cssincorp.com/pacterm The program works with Windows 95/98/NT and 2000

Also other programs for the KAM include XPWin by Gary Johnson and KA-Win by Stan Hutting. Both are good 16 bit control programs.

For Dos you have Hostmaster from Kantronics and KA-Gold from Interflex. Again both are good programs for DOS.

If you've got a KAM all mode, you have the standard KAM, unless it has been upgraded with the daughterboard and firmware. Keep in mind to run most of the above programs, the Kam requires version 7.0 firmware and above. If you dont have this, then you can get it from Kantronics. http://www.kantronics.com

616. FS: Kenwood TM-221A PACKET 2-mtr

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-13 00:00:00 UTC
From: "Alan D. Wilcox" <awilcox@suscom.net>
Message-ID: <38A70947.B4C2CF82@suscom.net>
Source record: 14346
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

After being off the air for about 5 years or so, it's time
to sell this fine rig and the 1270B TNC.

Kenwood: 5w or 45w, 144-148 MHz VFO with 14 memory channels.
Scan & CTCSS. With MC-48B DTMF microphone. Original manual.
Prob needs a new lithium battery; noticed it forgets memory
settings when power has been off awhile. Excellent condx.
See photo at http://yourpage.suscom.net/awilcox/Sales/Kenwood33b.jpg

I bought it new in '87 ($340) and used it as base station and
later connected it to MFJ-1270B packet TNC.

TNC is the standard MFJ with instruction manual. I added in a
circuit board for tone alert when digital connection is made
to the TNC: the Sonalert in photo does a Morse "C" for "connect."
Front view: http://yourpage.suscom.net/awilcox/Sales/TNCa34b.jpg
Rear: http://yourpage.suscom.net/awilcox/Sales/TNCb36c.jpg

Asking ...
Kenwood $ 150
MFJ TNC $ 70
For both together, $200, and I'll include the interconnect cables.

Terms... prefer cash or money order. You'll pay shipping and
insurance from 17701 (central PA).

Message-ID: <38A81714.345AAEF1@rpa.net>
Source record: 14207

Hi,

I have for sale a practically new Pervisell Demodulator/Modulator for PC HF Fax, Hamcomm, Pocsag and others. It will transmit Hamcomm, JVFAX, DL4SAW SSTV, Jvccomm32, PSK31 and similar programs using comm ports to switch PTT. This is the top of the line unit that has the leads to connect to the sound card. More information can be found at http://www.pervisell.com.

I'm asking $40.00 including shipping.

Please contact me by e-mail at wink@rpa.net

Thanks for reading!

622. remote HF radio control over packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-14 00:00:00 UTC
From: Mark Erbaugh <mark@nospam.microenh.com>
Message-ID: <38a82d5e$0$35534@news.voyager.net>
Source record: 14208

I'm kicking around building a remote HF receive site on a rural lot that I own about 16 miles away from my QTH (hopefully, we will build a house there someday, but for now...) I am investigating the possibility of setting up some sort of link over amateur radio. While I initially thought of something similar to Kenwood's Sky Command, I realize that I don't need to transmit HF from the remote site. I've a good enough transmit setup here (Force 12 C4S at 56 feet). I was thinking about just installing a computer controlled receiver at the remote site and then transmitting the audio back to my QTH over UHF. One possibility would be to use two UHF links - one over slow speed (1200 baud) packet to provide control of the receiver and another to transmit the analog audio (with appropriate ID insertion, etc). Another option would be to use a single high speed packet link that digitizes the receive audio and transmits that over packet. What kind of data rate would I need for usable audio, especially with a weak HF signal (remember if the audio is real strong / clear to begin with I can probably copy it from my home QTH)? Would 19.2K baud do it? Assuming 19.2K baud would do it, what kind of TNC and UHF radios are required? Is 19.2K packet equipment available? Where? How much? How can I get started? Would an analog audio link and 1200 baud control packet be less expensive?

I planning on developing my own software for this project. I've got a pretty good handle on the receiver control / packet communications stuff, but haven't much experience digitizing (should be easy), and compressing (the tricky part) the audio. I know it's doable (i.e. RealAudio and MP3); is there a good resource for rolling my own?

If I go with a digitzed audio approach, some of the newer radios use DSP processing. Is it possible to get the digital output of these radios before it is converted to analog and use that?

I haven't checked out the link, but it would be about 16 miles over relatively flat terrain with no major obstacles. I have a 56 ft tower at this end and will have something similar at the remote site. I pretty sure 440 would make it. If I go with two UHF links, I'd have to use another band for the other link. Would 902 MHz or 1.2 GHz make it with small fixed antennas up 40 -50 feet at each end.

I'm pretty sure that I shouldn't use 2 meters for the control link (even though the remote site isn't transmitting HF, it would be transmitting the received audio), but could I use legally use 2 meters to transmit the analog audio from the HF receiver?

Is there any merit to this idea? It intrigues me as a fun project.

73,
Mark

624. Re: remote HF radio control over packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-14 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <sagdlbp7ivs120@corp.supernews.com>
Source record: 14210

I think that with controls such as button selection, or dial tuning,
that 1200 would be quite sufficient. I would get one of those remote
control programs for the serial port on the radio, and connect the radio
serial port to one TNC, and put another TNC at the rural site. A couple
of old TNC's fixed in the TRANSparent mode would good enough I suspect.

My KAM has an "INTerface MODEM" command, and that may be the
proper mode. I don't have a manual handy...

Steve

Last question first, undoubtedly analog audio would be cheaper because
you can use nearly any off the shelf pair of FM radios to do it. Higher speed
digital requires a purpose designed RFmodem. That'll run you about $600
for each end (modem, transverter, and antenna) for a 56 kb system (WA4DSY
RF modem available from Paccomm). But a pair of $50 surplus Micor or Exec II
FM radios could handle the analog audio.

Now if you decide that you *want* to use a digital link anyway, there are a
number of codecs you might consider. There are codecs which can produce
decent sounding speech with only a 4800 baud link. That could be carried over
an ordinary FM radio like those mentioned above using HAPN modems. There
are other codecs which offer higher fidelity at the cost of greater bps, ie there
are voice codecs which operate at 9.6 kb, 19.2 kb, etc. One thing you should
keep in mind, however, is that these codecs depend on a clean voice signal
input for their compression algorithms to work correctly. A weak noisy signal
won't work very well because it doesn't fit the model of the human voice that
the codec compression schemes use.

To properly reproduce the weak noisy signals you want to convey, you need
something that is more on the order of straight CD quality sampling. That's
going to require about 22 kilo*bytes* a second, or 172 kb. You can use a
compression scheme to crunch that down so it should fit a 56 kb bitstream.
(8 kilobytes per second sampling might be sufficient for "communications
quality" audio, and that'll fit a 64 kb bit stream without compression.)

There's no reason to packetize this data for a simple point to point link. The
packet overhead doesn't buy you anything because you don't need packet
routing, and you don't want packets with a few errors to be discarded and
retried because that'll leave gaps in the realtime audio stream. Better to
just accept a few bit errors, which will slightly add to the noise of the original

signal. So you just drive the RF modem directly with the bitstream generated by the A/D sampler and compression engine you choose. A sound card works as the digitizer. You'll want to use a compression scheme that's tolerant of a few bit errors. Some compression techniques fall apart if they encounter bit errors. You don't want that.

627. 6-meter signal?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-14 00:00:00 UTC
From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Message-ID: <889gun$p76$1@campus3.mtu.edu>
Source record: 14213

Heard a very interesting "signal" today on 6. Right around
50.200. (It was drifting around near 50.202.300 - 50.202.380)

It was like a CW carrier that was shifting in frequency about
25Hz every quarter of a second, and that's all she wrote.

It continued like this, drifting in frequency quite a bit, for
from about 1800UTC (when I turned on the radio) until present
(1816 UTC) not sure how long it will last, but I've got to get
going pretty quick. I would think that its just a birdie, but
I've never heard this type of noise in the receiver before. No
movement on the s-meter whatsoever, solid 0 the whole time, even
when I could detect QSB aurally.

Anybody else hear this? The station is located in EN57rc, in
the UP of michigan...

Not much around here, so if anybody else heard it, I would feel
more intrigue, and be motivated to follow up on this further...

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-14 00:00:00 UTC
From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Message-ID: <889vuomoi1@campus3.mtu.edu>
Source record: 14216

My computer was originally what I thought the problem was, however-

1. I can hear it on multiple radios in multiple locales.
2. It has since changed.
3. There are patterns to it.

When I returned, there was, on the exact frequency, another signal
same shift, but much faster switching. It was transmitting now, not
in a continuous 0-1-0-1-0-1 pattern, but instead a different pattern:

00111010 00110010 repeat, repeat, etc. Always these two bytes.

Then the signal went to a dead carrier for about 2 minutes, dropped
entirely for 30 seconds, and back to dead carrier. I was noticing
much less drift in frequency the second time, at least until the
dead-on carrier started back up.

I'm going to talk to some others who live in adjacent cities, and
ask if they are experiencing anything similar, and hopefully
will have some sort of inkling as to whats going on again tonight.

What kind of PDA are you talking about here? I have used the D7 with a WinCE 2.0 HPC device with no problems. This site: http://www.qsl.net/kc7gnm/packet_hpc.html shows you how to set up terminal for a WinCe device. WinCE APRS coming """"soon"""" , someday.

The palm devices integrate with the D7 using Pocket APRS: http://www.pocketaprs.com/ quite sucessfully.

Pretty much anything that has a serial port and a terminal program should work.

Roger,

I have no working knowledge of the Harris but your problem sounds like an impedance mismatch problem. Perhaps the Harris is putting bias voltage on the mike input line and affecting the PK-232 output. Maybe the Harris uses a high level 600 ohm input and the PK-232 doesn't have the poop to drive it.

Just a thought.

COMMUNIQUE SPECIAL D'INFORMATION de la C.F.R.R.

du 5 f�vrier 2000 N° 2000-02

Jugement du Conseil d'Etat. Un fait sans pr�c�dent dans les annales du radioamateurisme fran�ais.
S�ance du 5 janvier 2000 - Lecture du 26 janvier 2000 - Notification du 3 f�vrier 2000
Les requ�rants ont re�u le 4 f�vrier 2000 la d�cision du Conseil d'Etat concernant la r�glementation amateur.

Extrait des conclusions du Conseil d'Etat :

« ..qu'ainsi les dispositions des articles 2, 3, 4 et 13 de la d�cision homologu�e par l'arr�t« attaqu« ont »t« prise par une autorit« incomp»tente ; que ces dispositions »tant indivisibles des autres articles de la d»cision 97-453 du 17 d»cembre 1997 de l'autorit« de r»gulation des t»l»communications, les requ»rants sont fond»s « demander l'annulation de l'arr»t« du 14 mai 1998 du secr»taire d'Etat « l'industrie en tant qu'il homologue cette d»cision. »

DECIDE

Article 1er: : L'arr»t« du 14 mai 1998 du secr»taire d'Etat « l'industrie est annul« en tant qu'il homologue la d»cision 97-453 du 17 d»cembre 1997 de l'autorit« de r»gulation des t»l»communications fixant les conditions d'utilisation des installations de radioamateurs et de d»livrance des certificats et des indicatifs

radioamateurs.

L'article 2 : (�num�re les noms et qualit�s des requ�rants.)

Cons�quemment,
"La R�publique mande et ordonne au ministre de l'�conomie des finances et de l'industrie en ce qui le
concerne et � tous huissiers � ce requis en ce qui concerne les voies de droit commun contre les parties
priv�es de pourvoir � l'ex�cution de la pr�sente d�cision."

La CFRR ajoute que pour toute information relative aux cons�quences de droit de la d�cision d'annulation, les
radioamateurs peuvent s'enqu�rir aupr�s de l'administration de tutelle ou de la seule des trois f�d�rations de la
concertation nationale ayant donn� quitus � l'ART.

Ce communiqu� est disponible sur le r�seau packet et Internet (http://www.cfrr.org) et libre de diffusion sous
r�serve qu'elle soit int�grale.

Fin du communiqu� n° 2000 - 02

You can download the schematic for the TAPR TNC-2 from ftp.tapr.org in the software_lib/tnc directory (tnc2sch.pdf or tnc2sch.zip, which contains the drawings in.pcx format). The manuals are there also (tnc2docs.zip).

> Has anybody some experience in using the soundcard of an Libretto 70CT to
> demodulate digital modes?
>
> The main problem is: how can I access the microphone of my soundcard?

As for compatibility, the sound card on the Libretto 70CT is SoundBlaster compatible so that part of it should be no problem. As for accessing the microphone, I only had use of a 50CT and there was no provision for audio =input= on that model at all. Could be there's a provision for it on the 70CT but I don't know for sure. Post this on comp.sys.laptops and you should get an answer. One of the Team Toshiba group -- Mark Lieberman -- hangs out there and is likely to be able to tell you if it's possible and if so how to do it.

Is anyone or any group currently working on a fully functional TNC made with PIC's? It seems these are very popular chips now.. and quite versatile. I would love to build my own TNC... in my own case... using these new chips. I am looking to do this for APRS and would love to build one with multiple rs-232 inputs for GPS, RDF and such...

Unfortunately I am not up to speed on PIC's ... yet... and would hate to re-invent the wheel.. if someone else is doing this already.

Important... but in French ! What a clever idea on an english-speaking newsgroup dedicated to... digital transmissions.

I do not really understand why you posted here a French dedicated court decision. Would you be kind enough to explain ?

May I suggest you first learn the way newsgroups work before posting and polluting them with your local fights ? :-)

73,

Eric, F5PJE

Yes, look at http://www.infracom-fr.com/9600g.html and look after the
TNC2MULTI : Pic processor, TF 2.7 Eprom, 1k2 & 9k6 in-the-box, etc.

It doesn't not include an APRS software, but considering you can
change the Eprom by a TAPR 1.1.9 one, it should not be a problem.

How do they manage to run al this Z-80 software on a PIC?

Probably it has a PIC *in addition to* all the standard TNC hardware?

For APRS, where you don't need the AX.25 protocol, it is probably possible
to construct something with only a PIC, that translates "ascii lines" to UI
frames. That is only slightly more complicated than KISS.

I've been looking into this, and the big issue is that
many protocols (e.g. KISS) require that the TNC store an
entire frame and validate the checksum before passing
it on. While the smaller PICs (e.g. 16F84) do not have
enough memory to do this, the larger ones do. My next
Digi-Key order will include a 16F877 which has enough
memory to do the job, and an on-chip UART as well.

I'd check the porting. I know of some clusters that use port 9000 as the default. If you are getting windows telnet to work, it might be using port 23 instead. Check the settings on the DXTELNET software to see what port it attempts to connect on.

Otherwise, I'd check my wingate logs out to see what connections it has been denying if such logs are kept...

I believe the original question still remains un-clearly answered and I
also happen to be interested in the outcome.

Try it this way: using current, widely available technology, what would
be a good choice to start out with packet.

Then let's talk more about high speed access....

After reading all of the responses on my news server, it seems that the QRM once again won out.

You asked for opinions and mine says "Great. Keep it up." Although it may be a hopelessly dead market-only if we let it. I am a new ham and have been unsucessfully looking for the required info to be able to interface my soundcard and rig together. Can I solder? That's not the question. Do I want to blow up either or both of my $1000+ radio or computer? I don't think so. And since I don't have money to blow, I had better do it right the first time. Anyone got a URL on the {correct} way to do this? Don't forget the drivers and related software to pull it off.

If I'm not able to make it work in six weeks, I may well be one of your customers.

Depends on what you want to do.

What do you want packet to do for you? How will packet solve your
data requirement?

Widely available covers just about everything. 9600 is the defacto
affordable
high speed (medium actually) packet. There is a little 19.2k packet but the
speed is not much better than 9600 using a TNC. P.S. I have a 19.2k link
using DRSI TNC, and Kantronics data radios for 430 MHz to the highest
bidder :-)

I've known some people who have packet links to their repeaters, and that's
all the use it for. 1200 baud is the rule.

APRS is pure 1200 baud, *never* will be greater speed.

TAPR sells (haven't checked lately) the best 9600 repeater TNC there is, and
tied to a Hamtronics true FM exciter/receiver, makes a cheap and easy modern
repeater. Users can use the little TEKK data radios to link up to a
central repeater.

One area I am interested in, is replacing all the hardware with a Linux box
that
uses a sound card to receive and regenerate the packets. Another area is
using
the DVSI vocoder chip to digitize voice to 9600 baud with FEC, and use a
digital repeater to communicate with others. You could even have a data
window for stuff like callsigns heard, what callsign is talking, the DGPS
could
be received and output on a port, etc. These data windows are cheap, and a
PIC can drive them using a serial port.

There's a lot that Hams can do with mere 9600, but their brains are stuck in
BBS, and AX.25 crap. The sooner we (Hams) leave AX.25, the better.

I've ordered some engineer samples of the new DVSI AMBE-2000 chip, and
I plan to commission a local engineering firm to prototype a microprocessor
controlled vocoder interface that can accept either a telephone handset or a
PTT microphone (Radio Shack compatible). My goal is to have audio and data
inputs, and audio and data outputs that can be used through a digital 9600
baud repeater, with the same device being used for a secure telephone
through an external 9600 baud modem, or a PPP configured serial port on
Linux. I think they will sell like Twinkies(tm), and they can all be linked
together via the Internet. I call it "Voda-Phone" :-) (Voice/Data-Phone).
Oops, that name is already a trademark, oh well...

Huh? What about the URLs I posted? I _once_ saw a KAM TNC here in
Germany at the USAR HQ's Club Station in Heidelberg (DA1US) where we
built a packet-node. We couldn't use it for anything because it
supports neither TheFirmware nor 6pack. The outdated Firmware didn't
even understand DAMA, has no Frame collector, ... It might have been
a good TNC about 5 or 10 Years ago, but for me it looked somehow
historic.

I would prefer a SCC-Card which is much more flexible and cheaper, and if
it has to be a TNC I would choose something like a TNC2Multi which supports
the standard bitrates 9k6 and 19k2 as well as good old 1k2 afsk. Or - if
it has to be cheap - the YAM, supports both 9k6 and 1k2. Or the EPP-adaptor
which supports everything between 1k2 and 600kbit/s and is cheaper than
a TNC. I gave the URLs some weeks ago. If that gear isn't available in
the US it doesn't make it worse, it is not our problem :) I can purchase
it here.

Tell me one reason to use a TNC noadays, it is more expensive, takes
extra space, likely supports only one modem, needs a dedicated
power supply (takes even more space), has problems with data curruption
on the rs-232, is limited by the speed of rs-232 (max 115kbit/s).

There has been talk of a KISS "discard frame" escape in some circles.
Since I use Linux on my home systems I have the source and can extend
it if I need to. There is nothing sacred about KISS, and other ways
exist to solve the problem (e.g. 6PACK).

> However, that will not save you from having a buffer, because:
> (snip...)

My initial inclination was something quick and dirty for 1200 baud
PACSATs. Then the largest frame I need to handle is 256 bytes, and
if I stick to UI frames (i.e. digipeating and downloads only), I only
need to process one frame at a time. You have to start somewhere... :-)

The 16F8xx PICs are attactive as well for their hardware UARTs. I
ordered
a 16F877 yesterday to see what I can do with it.

Yes, but I think it is useless in that application, because to handle the
pacsat protocols you need a computer that has to have reasonable power
(e.g. you probably can't get it to work on a Z-80 CP/M system), and such a
computer can do the required work all by itself.

A PIC driven TNC would be more interesting for small standalone systems,
e.g. remote control & telemetry, APRS, etc.

Let me put it this way: until my health took a nose dive, I owned and operated an ISP. I know what high speed can be. I know how much you subscribers complain when you are at the end of the line, thirty miles away and can't get that new Whiz-Bang V.90 modem to connect at more than 33k6! So why get 'stuck' with 1k2, 9k6, etc? A couple of people agree that there is room for improvement. For someone who has yet to bust a single radio packet, I'm trying to figure out which way to head. I'm looking at a PK-232MBX, but am not satisfied with it.

The local (2m) ham's say that there is no need to look for anything else. After all there isn't anything faster available in this (rural) area. I disagree, thinking that newer technology, especially sound cards, could bring back the 'edge' to everyday amateur radio. This would also help to create converts to amateur radio because a newbie wouldn't have to sink another $XXX to go wireless, he's already got the hardware to do it. Fine. But as soon as you mention 9600 baud, your prospect's eyes glaze over. Why? To the average internet aware person, that is a reminder of the 'dark ages.'

Remember how it used to be when hooking up your computer to another one? Everything was pretty much proprietary. That's what amateurs have today. Ask a simple question of what to buy, and look how the thread explodes. Trying to read every response on this thread and checking all the links, I still don't see any URL's on the sound card solution. Sure, maybe it's not the best solution, but it just MIGHT win a convert to amateur radio and save ME some money. See? I knew it was all about me ;-)

As far as I know, everything in your home-town is 1500% better
than anything across America. Anyway, that's how you make it all sound.

I called the Ham store, they don't have any German designs. Are
they exporting their equipment? Are they expecting Americans to
travel to Europe and buy them there? How come there are no links
from U.S. retailers to these German designs?

You're missing the point. Hams are no longer interested in exchanging
messages
in a chat (those that do are on APRS). They are no longer interested in
logging-on
manually to a BBS, and reading for-sale, or WW messages about life in rural
Equador. It takes too much time to sort and read that kind of data.

Sound cards will not suddenly bring Hams back to the keyboard. That use of
the
technology is over. Hams want the technology to do something for them.

The thread diverged because the Sound Card is merely a hardware change to a
failed mode. AX.25 is dead. It is a lingering death, but the day is done.

If you want a sound card solution, then get RedHat Linux and be done with
it.
It's already done, and simple to install. You can run Netrom, Rose, or any
protocol that is out there. Hook it up to your Heathkit 2 meter and rule
the
waves.

9600 baud is enough bandwidth to run 4 voice channels using a vocoder. Now that's something people can use. You could have 4 voice, or 3 voice and one data, or 2 voice and 2 data, etc, etc. You could run TDMA protocols at that speed. We don't, because AX.25 is less than $40 at the swapmeet. That's why people role their eyes, their mind is stuck in AX.25 packet.

It is not God's gift to RTTY, though. I had it in parallel with my
KAM+ this last weekend for WPX, and they seemed to perform
identically.
But it seems to do PSK31 pretty good, and of course is very good at
PACTOR. I'm going to try SSTV with it, real soon now.

Actually, my original post was a bit of a troll ... to see if there was
any actual data to back up that "Kantronics sucks" thread that comes
around every few months. There wasn't, of course.

> Try it this way: using current, widely available technology, what would
> be a good choice to start out with packet.

I have owned and used (at least) the following:

TAPR TNC1, TNC2.
MFJ 1270B, 1270C.
Kantronics KAM, KPC-3, KPC-9612, Data Engine.
AEA PK-232.
Tasco uTNC-21.
Heathkit HD-4040 and HK-21.

I presently have on air:

MFJ 1270B.
Kantronics KPC-9612, Data Engine.
Tasco uTNC-21.

Folks who run my software have used pretty much every TNC available.
They all work.

It ought to be possible to extend KISS with something analogous to the
HDLC abort sequence. That is, the PIC would indicate after-the-fact
that the preceeding frame was bad. This could be done, for example,
by defining two trailing sequences, one to terminate a packet with a
good CRC, the other to terminate a packet with a bad CRC.

Of course, this assumes that you can extend KISS, namely that you control
the software on the host.

On the other hand, a large-memory (well, OK, a larger-memory) PIC sounds
like more fun.

It would seem that DSP based solutions are the only thing that is feasible for the long run. If I were to spec out a new 'radio modem,' it would be required to be auto-negotiating for the various modes and speeds that it were capable of. Granted, a TNC has much more to contend with than a analog telephone modem, but the TNC should be able to do basically the same thing-negotiate and re-negotiate as needed to keep the connection alive. It should also be able to handle from (for instance) 19.2K to 110 baud using the same radio/TNC combination. Stop and think about it for a moment: if you had to own a different computer, use a much higher cost digital line, and a different modem to hook into different providers, would the internet be booming today? Not hardly.

TNC, sound card, whatever it takes to get up and running would be fine. But wouldn't it be nice to be able to start some serious data rates on air? Wouldn't that go a long way toward attracting new operators? The pool of people that have to be attracted scream bloody murder when they run into network congestion, slow connect rates, etc. And most of them consider anything less than about 44K to be slow. So you are going to sound foolish talking about that 9600 baud connection....

What I'm looking for is not impossible. (It's probably right under my nose...) But both cost and operations are a factor here. Any improvments would only help us all.

I liked the fact some of the European packet stuff is being sold as
kits.

Steve,
Saw your microwave page setup, your doing some fun stuff.
In reply to what can we do with it, think if somehow NEXRAD Radar
imaging during storms was combined with aprs, for each radio
club/township EOC was a goal, develop a fast network backbone, and leave
out the internet, then when storms aren't in progress, we would have a
lot of bandwidth. Would take more
networking of the social kind and less individualism. Also, the price
tag needs to come down.
Maybe it would expand nationwide.

Sure, but only when you can get it at a flea market and pay $30 or so.
When you want to start on packet now, don't buy a TNC. Use one of the many
other solutions.

>It would seem that DSP based solutions are the only thing that is feasible
>for the long run.

Yes, but we have heard this story for over 10 years, and the first cheap
and widely available (and used) DSP modem for amateur packet radio still
has to appear. I can remember (name of person deleted) holding up a first
prototype of the DSP-2232 at an AMSAT-UK colloquium and giving lectures
about how powerful this thing is and how nice and efficient the modems to
be written for it would be. But as we all have seen, this didn't
materialize and the product is sort of withdrawn from the market, after
many many years.

The implementations for soundcards have fared a bit better, probably
because the hardware already is widespread so it "only" takes a good
programmer to write the modem code and distribute it. That is one big
hassle less than to have to design and market your own box, and
additionally write the software (which then tends to be proprietary, and
usually no alternative software or even modem modules will become
available)

>Of course, this assumes that you can extend KISS, namely that you control
>the software on the host.

Instead of inventing yet another incompatible extension, you can use one of
the many existing "KISS plus checksum" implementations, and send a wrong
checksum at the end of the packet. The host will then discard it. At
least when it understands the particular KISS extension.

However, that will not save you from having a buffer, because:

- it will only work when the effective host-tnc bitrate is higher than
the hdlc bitrate. for this to be guaranteed the RS232 baudrate
must be more than 10/8 the HDLC bitrate (because of stop/startbits).
so you can't run your modem at 9600bps and the RS232 at 9600 baud!

- to be able to transmit, the RS232 bitrate would have to be EQUAL to the
above rate, and you could still run in trouble because of bitstuffing.
it would be more safe to assume that you will have to buffer (nearly) an
entire packet on the transmit side.

- as most host programs in KISS mode do not use any flowcontrol (it is
defined that way in the spec), the only way to do flowcontrol on transmit
is to discard packets the host sends. this will cause extreme
inefficiency when you can't buffer as many packets as the host program
uses as the MAXFRAME. assuming reasonable MAXFRAME settings (for a
low-end system, which we are likely talking about) this means you need
about 2Kbytes of buffer for transmit.

As usual, Steve does not know what he is talking about.
Perhaps someday he will put some radios on air and see what
is actually happening with ham radio. Of course APRS is run
at higher speeds than 1200, where there exists such network.
We had a lot of fun running it across our 9600 network for
awhile, until everyone became bored with it.

Why?
It tends to work better than most of the rest of the inexpensive gear.

Hello,

The first paper on Rake receiver is listed below.

R. Price and P. Green, "A Communication technique for multipath
channels", Proc. IRE, vol.46, pp.555-570, March, 1958.

Nowaday, rake receier is employed in both handset and basestation of IS-95 system (US CDMA system). In fact, the upcoming 3rd generation W-CDMA system will also use rake receiver technique for both handset and basestation.

If u want more details on rake receiver see the following paper,

G. Turin, "An introduction to spread-spectrum antimultipath techniques and their application to urban digital radio", Proc. IEEE, vol. 68, pp.328-353, March 1980.

Cheers,
Yuk Chow

In my attempt to understand this stuff, I've come across the fact that some people are using TCP/IP implementations running the TNC is KISS mode. Now, if the TNC is simply acting as a radio modem, can a sound card fulfill this function?

And why hasn't TCP/IP IV made more inroads into packet? So far, I'm mostly heard only a mention here and there about it. Aren't we able to NAT into private IP's or NETROM addresses? Am I so far out in left field that I'll never find my way back? After all, round six of TCP/IP is just around the corner and 128 bit addresses are upon us. Wouldn't it make sense to migrate on over, and again gain flexibility in the process?

TCP/IP I understand. Routing, switching, even firewalling is OK. The vast plethora of modes available to us ham's: I'm still lost. (But I'm beginning to see a star every now and then...)

I vaguely remember hearing that MFNOS, which is a NOS variant, had
support for IPV4, though this is only hearsay. Linux kernel has IPV4
and also has AX25 support, though I have no idea whether the two
would work together.

Does IPV4 have smaller headers -- or any tweaks specific to IP over
radio? How does IPV4 even work? Can you run an IPV4 radio network,
and then connect that to a reg-u-lar IP internet connection?

Not exactly. A classic TNC is a modem and a packet-assembler-disassembler in
one box. It usually has some amount of buffer memory as well. Even taking
into account the serial port overhead to connect a classic TNC to a computer,
a soundcard is much more expensive in terms of host CPU cycles.

Oops, yeah, you're right. IPV6. Really, I don't know anything about it
either. Though it seems like, gosh, if they're going to come up with
a new version of IP, that it'd be nice to have some stuff for the 'radio
problems.' I'd figured maybe to smoke out someone who new anything at all
about IPV6.

As a practical matter, though, you can run TCP/IP over ham radio with
a sound card + a radio with both Linux and Win98. Linux using the kernel
drivers and Windows using SV2AGW. I've done it, and it basically works.

(Though I need to climb up on the roof an straighten up, and guy my packet
antenna, which is now at a slight angle.)

Sure. When your computer is fast enough, it certainly can.
You can also use an SCC card with attached modem, this will cost a lot
less CPU power and will still be cheaper (and will perform better) than
a TNC. In fact, with a TNC in KISS mode you are using it as an external
SCC card attached via a COM port link.
(an SCC card is simply a HDLC interface for the computer)

>And why hasn't TCP/IP IV made more inroads into packet? So far, I'm
>mostly heard only a mention here and there about it.

To use TCP/IP effectively, you need a number of other stations in your
area using it, and preferably support in the network nodes (so that they
know how to route your IP packets). In some areas this has materialized,
usually after lots of advocating from a local enthousiast. In other
areas nothing has happened because the critical mass never was exceeded:
sometimes someone fires up JNOS on his PC, maybe telnets to a friend who
agreed to try it as well, but when there isn't a small community to talk
to, this experiment quickly dies.

Most node software authors don't believe in TCP/IP and offer only raw
AX.25 connections or datagrams through their nodes. This makes running
TCP/IP a lot less attractive, because you will need to setup and maintain
a whole routing table, including mappings between IP addresses and
next-hop AX.25 callsigns, on your own system. This is a real drag,
especially when you are not inclined to do such things and would like a
system that just works. This of course keeps more hams from using TCP/IP.

(in a TCP/IP friendly node environment, you just set your default route to
point to the IP address of the local node, and everything works. the
maintenance of the route table is delegated to the node sysop and/or an
automatic routing system)

Randy,

Thanks for the info, you're right about the drive level. After I'd consulted
the two manuals I found that the PK232 doesn't have enough drive, 100mv max
when I need about 5 times that! Will be making up a small amp to do the job.

Cheers,

Roger Basford

>have alluded to in you message.

In case you didn't notice: the fact that most nodes don't route TCP/IP is
politically motivated, not technically.
Of course it would be simpler to make an autorouter based on IP routing
than one on AX.25 callsign routing. You would have to convince the users
to use standard Internet software instead of dedicated packet programs,
and/or provide a way of tunneling oldfashioned AX.25 sessions in TCP/IP
sessions. But the packet node software developers chose to do it the
other way around. That is why setting up a TCP/IP-based packet station
is not the simplest of the two options, and it means it is less used.

Diodes are the way to do it, at least when the specs on the inputs do not
require a complete short to ground, but allow .7 volts at the input.

It's not political, or technical.

What would you do with a routed IP network over radio if it
was given to you on a silver platter?

Probably post for-sale, and out-of-band mods...

I've yet to see a serious application proposed for TCP/IP, ROSE,
or UI frames for that matter; except, maybe APRS beacons.

There has to be more reason than: "it's fun" or else the network
can't sustain itself over time. Once the Ham club loses interest,
you lose the tower space, and it is all down-hill from there.

Hams in the US, are just like other Americans, in that they have a
herd mentality. They will kill and maim for a cabbage-patch doll,
or tickle-me Elmo doll, and they will herd up to try out a new mode,
but once the "been there, done that" takes effect, it's all over.

The thing to do, is find what will cause the herd to stampede, but
then if we knew that, we'd all be wealthy and wise...

Download the demo of AirSCAN, software for the BC895XLT and a few other scanners. AirSCAN is a very convenient package used for finding and labeling active frequencies (similar to a "bandscope"), counting hits in frequency ranges, saving and loading previous searches, managing your scanners banks, counting hits on your existing scanner banks, and using the new "extended banks" A-Z adding 2080 more channels for your scanner!

Hello all...I'm interested in setting up for PSK31 operation and have a few questions:

I plan to use software that will let me use my sound card but need a cable/interface to go between the two.
Can someone reccomend the needed hardware or kit? My rig is an IC-725 and I have a soundblaster in my PC.

Thanks,

Agreed! Been there, done that, and now bored. Once the "network" been set up, and seasoned through the test of time with only a slow, declining usage "email" bbs system or three utilizing the network function, the excitement and challenge is gone. Any more the only advantage of packet radio over voice radio is that you can easily turn off (not read) the idiot messages on packet. "CQ DX - answer my calls you MF SOB! " Who needs it? APRS is about the only useful mobile data application (base station watching the map is like watching paint dry). DX Cluster is like shooting fish in a barrel. You're right - packet radio is now a solution seeking a need. Networking is a cooperative venture in a individualistic hobby - seldom works well. What's the old saying - too many chiefs and not enough indians!

Bah humbug!

Chuck,

I have RCA plugs on the back of my TenTec Omni 6+ for audio out and audio in. So it is just a couple of audio cables from the out to the in of the PC and from the out of the PC to the in of the Omni. Pretty simple hook up, but I don't know what type of connectors are on the back of your Icom.

Regards,

The IC-725 has an 8-pin DIN connector for the ACC(1) socket, probably
available at Radio Shack. It has +12, gnd, audio-out, audio-in, PTT,
and squelch.

708. RadioComm 4.0 DEMO Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-21 00:00:00 UTC
From: Josh <JoshP51@msn.com>
Message-ID: <#ojgW6Jf$GA.89@cpmsnbbsa04>
Source record: 14051

I found an impressive looking RTTY,SSTV,FAX,CW demod program from

http://www.bonito.net

Name of the program is: RadioComm 4.0 DEMO

It requires Pentium Computer running WIN95/98 and inputs from the
Soundcard's Line In or Microphone to the Receiver.

With the DEMO version, it comes with several .wav files of all the
different modes it can receive. However, I have not found anyway
to get the demo version to decode my own inputs from the soundcard.

Question: Can the Demo version be configured to process data retrieved from
my own soundcard and SSB receiver? I don't think it
can....

TIA!

Josh

Message-ID: <38B18E47.1BD8@ncr.com>
Source record: 14052

Are there any packages available for Windows95/98 which support AX.25 via KISS mode of a TNC? I'm currently running JNOS on a DOS 6.22 machine. As I understand it, my only other option is to use linux?

I don't need all the functions JNOS provides, since I just want to run TCP/IP over AX.25. I have been unable to find any drivers/stacks which would allow the TCP/IP stack of Windows 95/98 to bind to an AX.25 driver. Am I missing something obvious? Is writing this more difficult than it sounds?

710. Re: What about those computerless email terminals for packet?

Source record: 14053

Even at the $100 price, I think it would be a really bad idea. First of all, you would probably have trouble getting the RF modem to fit in a nice, concise package. Secondly, look at the alternative available. You can get a fully functional computer with which you can do other menial tasks, like track satellites and the like for well under that price.

(Maybe I'm just spoiled by the college scene, but a 486-66 with windows 95 is lucky to be worth $50)

Anyhow, one could stick a PK-88 without the cover (and a fan in place) right in a 5.25 disk drive slot. Haven't tried it with a KAM, but I would imagine it's about a similar fit.

And if you wanted to explore the realm of dumb terminals, oh my, are you in for a deal. I've sold entire table-fulls of these at $5 a peice. Hook up the TNC and you're out the door.

712. The Future of Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-21 00:00:00 UTC
From: Mike Blankenship <mikeb@rectec.net>
Message-ID: <38B229C0.4CF53BFD@rectec.net>
Source record: 14055

Where do you see the future of digital communications on amateur radio? Is there a future that could use the same basic software/hardware combination regardless of frequency? Or do we expect a future where there is no future?

I'm not asking for flame wars here. Just insight into something that has a real chance of attracting new people into our hobby. Before it dies due to lack of interest.

Look at the marketing being placed on 'internet ready phones,' 'email {non-computer} appliances,' etc. Attracting new people into amateur radio will be easier IF we have viable something to offer as bait that is fairly easy to implement. If you could say that 'yeah, I can get sports scores from the net using amateur radio', you might have a real chance at getting new blood in here. Of course, if you are opposed to all that new blood being brought into amateur radio, then just pack it in. Everyone knows that the hobby needs to grow-or fold.

Ideas, opinions anyone?

The TCP/IP nodes here (at least those that run my software, and probably the Linux ones as well) support IP Multicasting and would be a very usable medium for APRS. They would allow different frequencies in different areas (reducing collisions and channel load), and have done for years what the APRS folks now have re-invented as the "intelligent digipeater"...

Other protocols that have been used over here (in the days activity was a bit higher): IRC (the original protocol), Converse (the amateur-radio re-invented one), NNTP (news bulletins gatewayed from the BBS system, readable via a standard newsreader), HTTP, and of course the standard protocols. We have even tried X :-)

An even longer time ago, people thought sending code with a key
was a fantasy.

But that's part of the problem. People send messages from one
radio to another quite easily. Police cars have data, you can now
subscribe to internet via cell-phone data channels, etc. You're
not on a leading edge with packet radio.

Your question "should we try something new" is answered quite
simply: "Yes." For sure, but we don't know what that something
new is yet. The area I am playing with is Spread Spectrum high
speed links (1.6 Mbps), and a digital voice repeater (9600 baud)
that uses the new vocoder chips. I am setting up an Omni 2.4 GHz
antenna at 100 feet, and I will be interested to see how much
different the SS actual receive pattern is from the predicted FM one.

719. What about those computerless email terminals for packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-21 00:00:00 UTC
From: David Panek <dpanek@mindspring.com>
Message-ID: <88rh21$20q$1@nntp9.atl.mindspring.net>
Source record: 14195

There are several computerless email terminals now being marketed at people
that dont want to be bothered with a computer but want to send and receive
email. they are basically a keyboard with LCD display and a telephone modem.
Some have acoustic modems for the handset. they sell for $100-$200.
It seems that the telephone modem could be removed and a VHF/HF modem
crammed inside.
Seems like a good alternative to the Tandy computers used in mobile packet.
Any thoughts on this?

Digital Trio for Kantronics and AEA/Timewave TNCs to be released.

Muscle Shoals, Alabama. February 21, 2000 : Creative Services Software has announced today that it's putting its popular TNC programs, Wefax program and LogWindows logging program into a single package called the Digital Trio.

The Digital Trio package includes the current versions of the CSS software on CD and will retail for $129.95. Purchased separately, the programs would retail for $189.95. The CD also contains full documentation for all products in Word or PDF format, as well as demos of all CSS software and other supported programs.

The trio for Kantronics TNCs will include Pacterm '98 1.4, Wefax '99 1.01 for Kantronics and LogWindows 3.06.50.

The trio for AEA/Timewave TNCs will include PkTerm '99 1.4d, Wefax '99 1.01 for the PK-232/PK-900 and LogWindows 3.06.50.

Creative Services Software is at http://www.cssincorp.com.

I don't think that's really the decision we are making, Bill. I think we all realize that no matter who we elect, he/she will be another lying, swindling cheat and thief...

That's a given.

The real question, of course, is which lying, swindling, cheating thief looks and sounds best on television.

Nope, it doesn't match my license info. My license is set to my
permanent address, in the home town listed under my finger info.

If I were to change it as often as I change my apartments, I'd
be adding more cost and more waste to the FCC's paperwork jungle.

I get all my mail at both addresses, and I feel no reason to
change the FCC database info until I'm permanently located
elsewhere (Detroit, most likely) and am not going to be in
immediate contact with my ermanent address.

My question is why did you waste the bandwidth to post the
information made publicly available in my signature? If people
saw it, don't you think they'd look it up themselves if they cared?

I've got nothing to hide from, do you?

I guess it must just be related to the way CB'ers always post the
ham that annoys them's callsign info on the net. Those who don't understand or have some
reason to hide must think it is a major invasion of privacy or something.

725. getting Kam from Kiss->Cmd mode ?

Newsgroup: rec.radio.amateur.digital.misc

hi Folks,

How do I get my Kam from Kiss into Command mode ? I thought it was ALT-192 (on the keypad) ALT-255 and then ALT-192 ? That doesn't seem to work. I know CTRL-C and X gets from CW to Command etc... but whats from Kiss ?

ta,

Andy

using a terminal program at proper baud rate.
num lock on
press and hold ALT type 192 on the keypad release alt key
press and hold alt type 255 on keypad release alt key
press and hold alt type 192 on keypad release alt key

check intface command
did you perm it to kiss? See next line
hardreset wont work?

Joe Buswell K5JB (SK) wrote a simple program to enter/exit kiss for
kantronics,
might still be out on the web under JNOS or NOS file ftp sites, nice
little ditty.

Yip, thats exactly what I did. I haven't permed it into Kiss mode, and I reached Kiss mode through "intf kiss <CR> reset<CR>". A quick hard reset gets it back into command mode, but I'm writing some software (in windows) to use all the modes of the Kam. I can even get Linux to make it switch to kiss, but not back to command mode !

I think the firmware is version 8 (I think) and the unit is the original Kam (not Kam +) Would this maybe the problem ?

Message-ID: <38b25a23.0@news1.mweb.co.za>
Source record: 14064

I have a AEA/Timewave terminal node controller that works most of the major digital modes just fine (Using PK Term99). I am, however, in an advanced stage of setting up a satellite station and it is my understanding the PK-900 will not support some or any of the sat digital modes.

Would greatly value advice on what most dedicated sat users are using (hardware and software). Being located in South Africa where ham radio is dying on its feet (most of the major distributors have closed up shop for lack of support) so we're pretty much on our own.

Please reply directly to tgerry@global.co.za

Could be, the 192-255-192 sequence is not part of the original KISS spec,
but a defacto standard addition. In the original spec it was not possible
to exit KISS mode using a command via the RS232 line.

731. Digipan PTT problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-22 00:00:00 UTC
From: Roger Basford <Basford@btinternet.com>
Message-ID: <88tq3u$c5o$1@neptunium.btinternet.com>
Source record: 14067

Hi,

Just started using the new Digipan program for PSK31, seems to work well except for the PTT switching. I use the DTR line of my COM2 port to key all my other soundcard programs without problems but Digipan won't play! I have tried the RTS option but no joy with that. For what it's worth, the rig is an IC746 and the computer a Intel Pentium II with 64Mb Ram.

Any advice welcomed.

Roger Basford, G3VKM

School Round Up went well. The students at Brionnon (Washington) School (5th and 6th graders) really enjoyed their first on-air experiences. We made some very excellent contacts. See some pictures at http://hfradio.org

A reminder:

http://cw.hfradio.org - CW / Morse Code Resource center. Lots of stuff coming down the line. If you have stories, tips, links, and other things, would you share them with me, and allow me to post them on this new resource?

As usual, you are also invited to visit http://hfradio.org - a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

I almost forgot. Since you were such a bastard in posting his info, I
figured by replying you'd probably extend me the same courtesy. To save
you the trouble, like it's really that hard to dig up info, expecially
when someone includes it in their signature, here's all of my info for you
to digest. I know more than 20 other hams at this school too, do you want
me to contrast their personal info at college with that of the
FCC? Anyway, before I let you become an asshole twice in a row, which
will probably happen anyway if you reply, I'll save you the trouble:

COLLEGE:
----
name: Erlewein, Joseph R.
email: jrerlewe@mtu.edu
curriculum: Engineering Technology
address: 1055 S Lincoln Apt 1
city: Hancock
state: MI
zip: 49930
phone: (906) 482-8662
home_town: Traverse City, MI
status: Undergraduate, Enrolled Student
job_title: STUDENT CLER COMP TECH SVCS
classification: Student

FCC:
JOSEPH R. ERLEWEIN
2739 RA WA SI
TRAVERSE CITY MI 49684
USA
Class: General
Codes: HAI
Issued: 13 Nov 1997
Expires: 11 Jun 2001

Coincidence that both of our "HOME TOWN" fields from the mtu finger
database match our address city and state that the FCC has on file?
Maybe, Maybe not, you decide, and try not to be a complete jagoff about it
like you were with that last post. I know that's going to require some
effort....

742. RTTY Contest Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-22 00:00:00 UTC
From: Wink <wink@rpa.net>
Message-ID: <38B2A507.3597E6FC@rpa.net>
Source record: 14078

Hi,
I'm very new to RTTY and recently got my sound card set up to run using DOS and BTL. I worked the WPX contest a couple weeks ago using BTL but it was kind of a pain using the keyboard and macros for transmitting and paper logs. I'm running a 486/33 and windows 3.1. I'm looking for some contest software that will work with the Soundblaster and probably DOS. I use TRlog for normal contesting, so I'm familar with contest software. It was tough using a paper log again!

Tnx, Gary / N2UM

743. Kantronics GPS tracker closeout

Newsgroup: rec.radio.amateur.digital.misc

Cheryl at Kantronics and I had a nice conversation today and she asked me to pass the following to the group here.

This is a good deal for the APRS folks...

Kantronics GPS Tracker

$279.00
Closeout price

LIMITED QUANTITIES
Buy now while supplies last

KANTRONICS GPS TRACKER features:

1. Integrates a Garmin-25 module GPS receiver, and a Kantronics KPC-3+ packet modem in one convenient package!!!
2. Includes a Garmin GA-27 Active Antenna with metal/suction cup mount
3. Superb vehicle locaton
4. Stand-alone GPS receiver
5. Full featured packet radio modem

• PLACE YOUR ORDER BEFORE FEBRUARY 29, 2000. Orders must be in writing, and received at Kantronics by 5pm. Orders ship as they are produced.

Call Kantronics at 785-842-7745 or email sales@kantronics.com to order

It's a tactic very well known among the "Independent Party" types. Remember the "Liberty Net" jerks who formerly (before Hollingsworth) were such a problem on the low bands? Those sniveling jerks resorted to the same sort of "tactics" that this one has, against anyone who disagreed with them in any way. It's a particular brand of cowardice that appears to be basic to the independent party's "character". Not all of them are sniveling cowards, of course, but it appears that very many of the more outspoken ones are.

Don't be surprised to get hate mail, E-mail bombs, nasty phone calls, etc.. A local "Liberty Nut" type harassed my family for months, a few years back, until he was mysteriously found in a dark, lonely place, pumped full of nine millimeter rounds. I appeared that he had tried his intimidation tactics on someone who chose not to be intimidated. Keep that in mind if this jerk or his buddies get to be a problem. They can only pester you as long as you choose to tolerate it.

They have developed the art of stalking and harassing people while dodging the law to a fine art... But they don't appear to be better than anyone else at dodging bullets. - Another good reason to protect our right to keep and bear arms.

747. Re: RadioComm 4.0 DEMO Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-22 00:00:00 UTC
From: Josh <JoshP51@msn.com>
Message-ID: <OZDYNkXf$GA.257@cpmsnbbsa05>
Source record: 14083

It works great with the supplied .wav files of the stations listed in the
Freq/Station Folder shown in the RadioComm control panel.

Just click on one of the stations listed and that (.wav) file will start to
play.
Then you have to manually set the proper mode and frequency shift on the
control panel, etc., to tune the station (playing from .wav file). Once
RadioComm 4.0 Demo
is synchronized with the pre-recorded station (.wav) it decodes like a
champ!

The trick is getting the DEMO version to receive inputs from your
own receiver and soundcard.. I don't think the Demo version works with
soundcard? :/

Still an impressive program though. It has an oscilloscope and audio
spectrum analyzer
built right in.

Thank you for your interest in our training Course! We offer the most extensive training course in "How to Collect Judicial Judgments" available!!! In fact, we created this industry.

If you are like many people, you are not even sure what a Judicial Judgment is and why processing Judicial Judgments can earn you very substantial income.
When one person or business files suit against another person or business and wins, then winner than has a Judicial Judgment. You are happy you won, but you will soon find out the shocking
fact: "Its now up to you to Collect on the Judgment". The court does not require the loser to
pay you. The court will not even help you. In fact, employees of the court are forbidden by law from
telling you how to collect the judgment. Basically, the winner has a piece of paper. You must trace the loser down, find their assets; their employment, bank accounts, real estate, stocks and
bonds, etc. The nations most recognized private investigator will teach how to do it all!

Very few people know how to find these assets or what to do when they are found. The result is that millions of Judgments are just sitting in files and being forgotten. This is entirely
non-
confrontational and requires no special licensing.

Right now in the United States there is between 200 and 300 billion dollars of uncollected Judicial Judgments. For every Judgment that is paid, 5 or more Judgments take its place.

The income potential is substantial in this profession. Using the techniques taught in this course, people are now working full-time making $96,000.00 to over $200,000.00 per year, Part-time
associates are earning between $24,000.00 and $100,000.00 per year. Most choose to
work out of their homes, other build sizable organizations.

Today, people trained in this business opportunity are processing over 500 million dollars in
Judicial Judgments.

So, if you've ever dreamed of the financial freedom that owning your own business can provide. Dreamed of an early retirement, this may be the opportunity for you. None of your days will be dull.
You will be mentally challenged. This business protects you from corporate downsizing. This business is your ticket to freedom from others telling you what to do. This business lets you

control
your destiny! Our training has made this happen for many others already, Make it happen for you!

If the above sounds interesting to you then its time for you to talk to a real live human being,
no cost or obligation on your part.

Please call us at 1-303-423-9190, between the hours of 1:00pm - 6:00pm Mountain Time
(our mornings are reserved for support of our associates), Monday -friday.
Thank you for your time and interest.

Source record: 14088

Hello,

I have been using the MFJ-1289W Multicom software for years with Windows 3.1, 95, & 98. It works great. Just recently I did run into one problem with it. I was going to switch monitors between my computer & my 10 year old daughter's computer. She has an old regular VGA monitor and I have always run mine in SVGA mode (800x600 versus 640x480). When I switched video modes to the 640x480, Multicom would not load. It came up with multiple errors. A switch back to 800x600 & it was back to normal. I think what occurs is Multicom needs the higher resolution for SSTV & FAX modes. Otherwise, I have never had any problems with this program. It is extremely user friendly. I use it with my MFJ-1278B. I have never tried with any other TNC though.
If you have anymore questions, please feel free to ask. Good luck & 73's.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Hi guys. I have two questions, one more specific and one more general, that I was hoping someone on here could help me with.

The first: I'm looking for information on using TCP/IP over an AX.25 newtork. By that I mean more than sticking the TCP/IP packets in the information field of the AX.25 packet, but rather how to find routes for my AX.25 packets in the first place. Maybe my second question will make the first more clear.

The second: I'm wondering whether there is a way that two remote stations could contact each other by hoping packets through some network without having to have static routing information (say if the first station is mobile). What I am asking, really, is whether there is some mechanism out there (which people actually use) that allows my first station to send out some sort of "request for route" and establish a connection (whether TCP/IP or otherwise) to the second station. It doesn't all have to go through the air and I don't mind if the route goes over wired TCP/IP.

To hammer this question to death, I'd like to know whether there is a way that stations A & B can contact each other through station C without having to make specific arrangements with station C, but, rather, that station C happened to be in between and "volunteers" to route packets.

Sorry for the mess,
Danny

Been out of the scene for 5 years, but let me give this a shot from
memory...

Yes, you can do this, but station C has to be set up to be a
digipeater(a term from the golden age of packet) or a network router
running NETROM(or an equivelent), or of course, a TCP/IP router. I
remember doing this all the time out here in Riverside County... It was
just a matter of setting up the TCP/IP route tables correctly. I
remember doing some real cool stuff, like replying thru a second route,
that wasn't on the same frequency from the first route(so they wouldn't
interfere with each other), to get my transfer rates up.

By the way, if "station C" is NOT set up to digipeat, or route, forget
it... you can't hack that station to do your bidding.

For stations that can hear each other, the ARP protocol (at the IP level) is
sufficient.

For stations that cannot hear each other, but are heard by a commonality of
other stations, Net/ROM is one solution. Each TCP/IP station will have to
manually add into the ARP table the IP and Net/ROM addresses of the other.

Other than that, a dynamic IP router program (rspf, or something that supports
the RIP protocol, etc.) will be needed. These do not work on a "request for
route" theory, but do work on a "I have a route to X" available.

Hello folks. Have this old-timer here, and would like to dust off the Commodore C-128 and play with RTTY and keyboard generated CW (yeah, I know, but I just want to try it). I have the Interface, I have the documentation for the device, and I have a diskette with the software on it. Only problem is that I do NOT have the cable to connect the computer to the Interface. Can anyone provide either a pinout of the cable at each end or direct me to a resource on the internet that can provide the info? I'm also interested in connecting this little goodie to a PC, so a pinout of that cable would be quite helpful as well. Thanks much!

Just for info, the firmware is version 6.2 and neither Alt-192, Alt-255,
Alt-192 OR Alt-192, Q, Alt-192 seem to work :(

bummer.

just have to power it off/on !

Thanks

Andy

Have a look at (X)NET which offers a lot of tcp/ip functionality:
http://www.qsl.net/dl1gji/
It runs on a variety of HW and OSs. Interesting in this context: (X)NET
offers a feature called "learning ARP".

I have been using it with WIN 95 with no problems.

However for RTTY contests I have found Logger to be the best one to use.

While browsing information about packet radio, I found a site at
http://www.wa4dsy.radio.org/. This site was connected to the Internet
at 56k.

I was wondering if there was any way to modify this type of setup
so I could access the Internet from one TNC connected to my laptop
and another connected to a Linux box here at home. The Linux box
has a 28.8 modem and is a 486.

What is the minimum speed that both TNC's should support in order
to keep myself from tearing my hair out waiting for Web pages to load?
What other concerns should I watch out for (besides no business-related
stuff)? Maybe something which blocks out inapporiate language or maybe
a filter that blocks porn too?

And how do I make this setup work in Windows too? All I've seen is AX.25
stuff for Linux, which the laptop doesn't have.

768. Data rf frequency...which one?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-24 00:00:00 UTC
From: pmarkham@newsguy.com
Message-ID: <8EE4859A8pmarkhamnewsguycom@207.211.168.82>
Source record: 14104

I was told by Cliff Buttschardt, K7RR, after a long wrangle on APRSSIG some years ago, that mark was the lowest EMITTED rf frequency. He asserted that the definition (his/mine, above) was the standard for all commercial hf data stations. The definition he provided made all variations of radios, tncs, modems, etc. irrelevant regarding discussions of rf frequency of operation relative to typical amateur operations, and commercial?

I did not research his assertion, then, as it was unequivocable, from high authority, and given all the other options I heard, read or considered; made the most sense ;-) It is possible that he, and consequently me, got it backwards. But....

The definition that Cliff provided and I embraced, wholeheartedly, requires technical knowledge of the mode and equipment used. That technical requirement is inconsistent with most folks current view of the world that they can be or do anything with little to no knowledge. To foster the current view, specific instructions are often given for a specific activity with little concern of "universal" definitions given to the jargon used. Consequently, confusion reigns, and apparently, relative to the topic at hand, as far as I am concerned, still does!

This morning, I spent a few hours searching the internet for a definition with authority, and failed. I did find several that referred to the mark rf frequency as corresponding to the lower mark afsk modulating tone. Those definitions were predicated on the premise that the rf mode was lsb and the data mode was "sense" sensitive, such as Pactor.

Cliff's definition was predicated on defining the lowest emitted rf frequency for the mode considered and from there it was up to the operator to set up his unique equipment, correctly, for the considered mode.

If someone can provide an authorative reference, I would appreciate it.

Pete/wa4hei

Maybe not authoritative, Pete, but a just a data point for you. My SCS PTC2e manual says Low tones, 1400Hz mark frequency, 1200Hz space frequency is used with USB operation. High tones, 2100Hz mark frequency, 2300Hz space frequency is used with LSB operation. From the developers of PACTOR, mark is obviously the *higher* frequency.

Hello guys, and thank you for all the prompt responses that I got.
However, I think I phrased my question wrong despite my many attempts. I
have received replies concerning different dynamic routing protocols and
different software systems that I may use, BUT, what I'm more concerned
with is this: is there some protocol or software system that people out
there USE, which constitutes, in essence, some existing infrastructure?

If I put up a transmitter somewhere on the globe without making special
arrangements with people in the area to capture and forward its packets,
can I count on there being a nearby station that supports one of the
dynamic routing algorithms that people mentioned, so that it will
nonetheless receive and forward my packets after my receiver requests it
to?

Thanks,
Danny

KA5ZTX has a set of pages for wiring TNC's. I don't have the link offhand, but it's listed on http://www.qsl.net/scdcc/links.html (could be scdcc/misc/links.html). There are also some other sites.

No. There is often no cooperation between amateur radio operators of a high enough level for such an organized network to exist. In my area, getting any 5 operators to agree on anything is a miracle.

Do you mean "bit stuffing"?

Bit stuffing is a technique used by bit-oriented link-level protocols
such as HDLC to ensure that the flag character (which is used to delimit
frames) never occurs within a frame.

How do you propose to delimit frames, if you don't use something like a
bit-oriented protocol, flag characters, and bit stuffing?

(I hope you aren't proposing that we regress to the byte-oriented
protocols that preceeded the bit-oriented protocols, complete with
escape characters. I suspect you never had to deal with a byte-
oriented data stream, such as a BSC 3270...)

Amen.

However, Daniel, it isn't just the amateur community that is at fault here... It is the entire Internet community. Let's say you wanted to plug your laptop with an ethernet card onto a TCP/IP ethernet network at any random job site - you wouldn't expect to be able to just plug it in without getting an IP address coordinated - WOULD YOU? Of course not. So how on earth would you expect to get a similar thing to work in the amateur community with the situation described aptly by kd6lvw?

I remember when I was first getting into packet radio networks - and I was trying to bring my expertise from my computer science background to help coordinate the packet networks here in SoCal. I came in very optimistic - but within a very short time I began to see the truth(as described by kd6lvw). Then one guy that had finagled his way onto the board of the SCDCC(Southern California Digital Communications Council) gave me this very good piece of advice; "If you want to be successful in LOS radio(packet included), find the very highest antenna site, and transmit with the highest possible transmission power. In other words, just blow people away, then they will have to worry about coordinating with YOU, not vice-versa. I heeded this advice, and kissed-ass with some locals that controlled some mountaintop sites. I was the first one to set up a 9600 bps dynamic IP router/NETROM node in Southern California in 1994(the kind of thing you have been dreaming about,

Daniel). Unfortunately, I tried to use some Kantronics Data Engine English software contraption(JNOS/BPQ) that was a total piece of crap(I doubt that the EVER got the bugs out of it) - so it had to come down off the mountain after two weeks(if it had worked, it would have been COOL). I tried desparately for three weeks to configure it in a way to get it reliably working in a high-stress environment, without luck(it was a hopeless abortion). So, I started working on a Linux AX.25-TCP/IP based solution after this, with the idea of putting a rugged laptop up on the mountaintop - but this was ANOTHER exercise in futility(in the Linux world, I have learned that the "working" release was always "just around the corner"). I finally gave up on this amateur stuff in about 1995 and went off the air(with a brief respite in 1997 to check out the fledgling(read buggy) GPS and APRS). This was about the time that telephone modem technology SHOT past ham radio modem technology. Nowadays, you hear of 56kbps connections, and cable modems at 1Mbps and above, etc. - but hams are STILL transmitting at 9600bps max, and are just now getting some decent little toys to take advantage of that sickly data transfer rate(the new Kenwood TH-d7a radio looks cool).

Yes you certainly would, with DHCP. The DHCP server allocates you an address and away you go. In everyday use for years.

56k is the minimum when you want to have a speed that is comparable with
what you get on the 28.8 modem on a telephone line...
(it will probably still be slower in most cases)

No. The closest you can get to that is using the packet satellites, but it
is a store-and-forward operation. So you can send mail (and the mail is
binary transparent, so you can use it to send files too), but not
individual packets that travel directly to a destination.

On the land networks, there is no globally agreed standard protocol. Not
even for routing AX.25, let alone TCP/IP.
(node software designers misjudge IP as a "level above AX.25" to be
routed "over the AX.25 routing mechanism in use", instead of the other
way around)

What is your problem ?

I have written quite a few protocols and maintained even a larger
number, some of which use transparency characters (usually DLE) to
delimit characters required by the protocol itself. The main
disadvantage of this mechanism is that in some pathological cases with
the data containing a only protocol characters, the total number of
bytes may be doubled, but the average increase is much less than that.
I much rather use byte oriented protocols to transfer octet aligned
data, since much less processing have to be done in software (the
situation may be different e.g. when transferring 11 bit image samples
or other variable bit length data, in which case a bit oriented
protocol is referable).

Bit oriented protocols are nice if the raw BER is very low and the bit
stuffing part is done in hardware, where it should belong.

However, in environments where the BER is high, as is the case in
amateur radio connections, the situation gets nasty. A single bit
error can upset the bit stuffing removal, thus the byte synch can be
lost and all the data in the frame is useless, until the end flag is
detected, thus a bit error becomes a block error.

In synchronous byte oriented protocols, a single bit error does not usually upset the byte synch, thus the rest of the frame is decoded correctly and can be used. For keyboard to keyboard amateur communication, a few bit errors may be quite acceptable and there is not even a need for retransmission. In more complex situations, maintaining byte synch simplifies implementing data interleaving and error correction, thus, a bit error does not necessary cause a block error and thus, there is not a need for a retransmission.

Implementing interleaving and forward error correction on bit-stuffed protocols would require quite a lot of heuristics, e.g. scanning forward from the start flag and backwards from the end flag and trying to find turnover points, which would give an un-stuffed bit count that is divisible by 8 (or whatever the character length is :-).

In reality, there is usually no difference. Bit-oriented protocols are
usually handled by communication controller chips (like the SCC) that
internally handle 8 bits at a time, and store the bits as bytes in memory.
The only viewable difference is that the last byte stored need not have 8
bits actually valid, so there should be a "bit count in last byte" dragged
along with the data through all subroutine interfaces. This is normally
not done, and an 8-bit multiple is implicitly assumed.

The software that wants to send 11-bit samples usually has to put these
in memory in a contiguous fashion, and they will be sent just like any
8-bit data. No difference between bit and byte oriented protocols....

When the processing is done by software, e.g. in a Baycom modem or a
soundcard driver, the difference is that the "escaping" state machine works
at the level of bits (has a ones-counter and inserts zeroes) instead of
at the level of bytes (looks at specific byte values and inserts DLEs).
As the driver operates at the bit level as well, this actually is more
convenient than byte-level escaping. As soon as the message is completely
transferred to a buffer, there is no difference to all the upper layers.

I don't care. Pick one. Hell, pick both of them.

Now, tell me what you could use it for? Is this wonderful new protocol
going to transport out-of-band mods? WW filler? Dogma? What?

Tell me what I'm going to do with this new infrastructure, or tell me
what problem requires a solution. I don't see a need for host to host
communications in Ham radio anymore. I see only add-on features,
like digital data between radios (position, callsign, etc). This can be
done with a preamble burst just before you begin talking.

I say that, because Part-15 radios have surpassed Part-97 radios,
and have an Ethernet card form-factor, with speeds 10,000+ times
faster than what Hams are fighting and jamming each other over.
Netrom, Rose, Flexnet, Jimmy-net, Bobby-net, him-nos, she-nos,
give me a break...

HF protocols are good enough for the limited channel they have to
operate in. Bits, bytes, who really cares anymore?

Steve appears to believe that Ham-to-Ham communications are useless because he doesn't approve of what Hams tend to say to each other. "Why have a packet network?" Steve seems to be saying... It'll just be Hams using it, and Steve has trouble understanding why Hams would want to communicate with each other. If it's not what he is personally doing or saying, then of course it has no relevance and should be supressed, downgraded, denigrated.

> Tell me what I'm going to do with this new infrastructure, or tell me

Here Steve describes (in part) the limits of his vision.

>

And here Steve expresses the opinion commonly held among LandLine Lids that if digital Ham communications do not go at a great rate of speed, then of course they could have no relevance or utility.

>
> HF protocols are good enough for the limited channel they have to
> operate in. Bits, bytes, who really cares anymore?

Hams do. Too bad Steve doesn't. (In a way... In another way, it's just as well.)

Steve has done a great job here, as usual, in descibing the intellectual limitations and character flaws inherent in the LandLine Lid community.

Thanks, Steve!

When 8 or 16 bit characters or 16 or 24 bit samples are to be transferred, these entities can be very effectively constructed from 8 bit wide octets in all computer architectures, since most architectures are byte addressable, not bit addressable.

However, if some strange character/sample length (say 11 bit, or even worse varying according to some predetermined system) is to be transferred efficiently in a packed form, thus, when the receiver chip stores this streams into 8 bit bytes the sample boundaries are different from byte to byte. In order to be able to postprocess these samples, they must be converted to one sample/word, which typically is 16 - 32 bits. Thus, the 8 bit bytes have to be split into bits before being reassembled to 11 bit samples, each of which is to be stored into a 16 or 32 bit computer word. Thus, it would be preferable to have the input data directly stored by the receiver as 1 bit in each byte, in which case the bit stuffing removal can as well be made in software.

I haven't read the details on AX.25, but I have a guess as
to what you are saying. Perhaps the root cause of the problem
is that X.25 includes both data link and routing stuff.

Although X.25 Packet Layer Protocol is interesting, history
has shown that IP datagram routing is more flexible and robust.
Thus, what's in wide spread use for the Internet is:

TCP ISO level 4, "transport"
IP ISO level 3, "network"
ethernet ISO level 2, "data link"

You seem to say they suggested redundant routing:

TCP ISO level 4, "transport"
IP ISO level 3, "network"
AX.25 ISO level 3, "X.25 PLP network stuff"
AX.25 ISO level 2, "X.25 HDLC/LAPB data link stuff"

What they should have done was use only the data link part
of X.25 and just use IP for the routing to keep things simple:

TCP ISO level 4, "transport"
IP ISO level 3, "network"
AX.25 ISO level 2, "X.25 HDLC/LAPB"

I've seen this option when setting up my PCs. Problem is you would have
to have a server set up to do this. Never seen one of these animals
ever in the real world.

Once again it goes back to getting people to coordinate and give up
"control". All it takes is for a few "control freaks" to get into the
fray, and they block "coordination" efforts with
disinformation and misinformation. It is maddening. It also happens at
the amateur level; and I'm sorry to say, it is actually WORSE at the
amateur level.

I remember these modems back in the early '90s. I was all kind of experimental back then, and kit based - came out of Georgia(GRAPES), I think. I live in SoCal, and the problem back then was that there wasn't a critical mass of folks using this stuff. In fact nobody was using it - it was hard enough to get people to go to 9600bps back then(it probably still is, I would guess).

I'd be interested in hearing from people in the Southern California area who are/have experimented with wa4dsy technology.

Also, the powers that be here in SoCal are redistributing the 440-band frequency allocations to 20khz spacing from 25khz spacing. I would like to know what bandwidth the wa4dsy modems take up.

It varies. We have MFJ1270b's and C's, MFJ1274's, PacComm Tiny 2's and Spirits. All exhibit the same problem. The only commonality is that they are all running X1J4. I don't even know what the trigger is. The node will be happy as can be for weeks or months and then locks up. Strangely though, when this does happen it usually happens in bunches. i.e. the network will be fine for a period, then we get a bunch of nodes act up over a few days and then after resetting them everything goes back to normal. It is almost like something traveling through the network upsets the balance.

Man, you left out NETROM nodes. I don't know about today's networks(got
out of it 5 years ago), but it used to be that the "control freaks"
that were in charge of key networking sites loved their silly NETROM

nodes(that gave them little dictator status), and weren't gonna give them up for nothing.

Then there were the IP coordinator Hitlers and Mussolinis. They used to ignorantly, greedily and stupidly hoard their huge banks of unused IP address allocations, while amateurs were being threatened with having to give up there ample IP address allocation - because they weren't using them! One time, I was trying to set up subnets for a "serious" cross frequency network in Riverside County - and my coordinator just didn't get it, even when I totally spelled it out in writing, and he wouldn't give me any 8-bit subnet address allocations - so I just said "screw 'em" and picked my own. He went running to Phil Karn, or the National IP address coordinator, or somebody or other, who helped him understand I was doing the right thing - so he finally(weeks later) relented to my "choice" of subnet addresses. It was way up in his 16-bit address allocation block, and I guess he finally saw that it posed "no threat" to him and his "control" efforts of the uneducated masses.

You've got to understand that this whole amateur packet radio thing is by definition experimental and is COMPLETELY OUT OF CONTROL. Everyone goes with their own thing, kinda just playing around. Don't EVEN think of seriously trying to make something more out of it, or try to make sense of it - you would go MAD. And when it comes to turf wars, amateur radio is nothing - if you want a total free for all, try youth sports!

For most hams, it is just a big sandbox to play around in and have fun. Nothing more, nothing less.

>I haven't read the details on AX.25, but I have a guess as
>to what you are saying. Perhaps the root cause of the problem
>is that X.25 includes both data link and routing stuff.

First read the details... The AX.25 protocol has little or nothing to do
with the X.25 protocol!

>Although X.25 Packet Layer Protocol is interesting, history
>has shown that IP datagram routing is more flexible and robust.
>Thus, what's in wide spread use for the Internet is:

>TCP ISO level 4, "transport"
>IP ISO level 3, "network"
>ethernet ISO level 2, "data link"

>You seem to say they suggested redundant routing:

>TCP ISO level 4, "transport"
>IP ISO level 3, "network"
>AX.25 ISO level 3, "X.25 PLP network stuff"
>AX.25 ISO level 2, "X.25 HDLC/LAPB data link stuff"

There is no 'AX.25 ISO level 3, "X.25 PLP network stuff"', except
in the ROSE nodes which are not very widespread. Most nodes use NET/ROM
or FLEXNET, which are routing protocols that use a message structure
completely different from X.25 PLP.

>What they should have done was use only the data link part
>of X.25 and just use IP for the routing to keep things simple:

>TCP ISO level 4, "transport"
>IP ISO level 3, "network"
>AX.25 ISO level 2, "X.25 HDLC/LAPB"

You are missing one part: there should be a "service" that accepts
AX.25 connects (level 2, that is all there is) from users, interprets
their requests for further connects to other nodes and users (possibly
deriving this info from the "digipeater" fields) and tunnels the data
they send in a TCP session to the remote node, which sets up another
AX.25 connection to the end user.

This service allows end-users without interest in TCP/IP to connect to
other users or services that are AX.25-based via the network, while the
network itself is purely IP based. That means that other protocols can
be used at level 2 internal to the network, as long as they can serve as

a link level to transport IP datagrams. In some countries it may be
AX.25 (to avoid license hassles), in other countries it could be raw
HDLC or a better protocol that allows for FEC etc.

797. KENWD TR-8400 mod 9600bd?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-25 00:00:00 UTC
From: root <nl7iy@asat.org>
Message-ID: <38B72497.123A4347@amsat.org>
Source record: 14133

Hello All,
I have a Kenwood TR-8400 UHF rig and I would like to convert this rig for 9600 baud ops. I was unable to locate any mods for this rig on the internet. Does anyone have any idea where I may locate such mods?

Thanks in Advance.
Regards,
Mark

> course it has no relevance and should be supressed, downgraded, denigrated.

Blow me.

I'm saying that Hams have abandoned packet radio because the data that is
being transported is of little value. If Hams won't participate at 1.2 kbps
reading
and writing this junk, why would they suddenly read and write it if the baud
rate
were 1.2 Mbps, or the protocol was a bit protocol, or a byte protocol.

I'm not denigrating anything. I just don't see the logic.

> > Tell me what I'm going to do with this new infrastructure, or tell me

> > like digital data between radios (position, callsign, etc). This can be
> > done with a preamble burst just before you begin talking.
>
> Here Steve describes (in part) the limits of his vision.

Blow me.

OK, well if host to host communications are dying faster than hogs at
a slaughterhouse, I don't see data communications growing, outside of
fascilities to voice communications.

> > I say that, because Part-15 radios have surpassed Part-97 radios,

> > give me a break...
>
> And here Steve expresses the opinion commonly held among LandLine Lids that
> if digital Ham communications do not go at a great rate of speed, then of
> course they could have no relevance or utility.

Blow me.

I'm saying that given that Ham radio is limited in free speech content, and
Public radio is not, why choose Ham radio over Public radio?? I can
say "the seven FCC non-words (shit, cocksucker, motherfucker, and tits)"
and show mammary glands on Public radio infrastructure (Part-15), but I
would be fined or lose my license for those words and pictures on Ham radio.
It's obvious to me which one has more freedom and function, even for those of
us who don't collect mammary gland or hydraulics photos.

> > HF protocols are good enough for the limited channel they have to
> > operate in. Bits, bytes, who really cares anymore?
>
> Hams do. Too bad Steve doesn't. (In a way... In another way, it's just as
> well.)

Blow me.

Shit, Hams are too cheap to buy a good HF protocol that is available now.
You have to buy this stuff, because it takes an engineering degree to understand
the DSP functions, and algorithm required to achieve the transport. You can't
homebrew something you can't understand. It's not resisters and capcitors
anymore. You really do have to know how to A/D, D/A, and do digital
DSP based algorithms. I know Hams who can do DSP without an engineering
degree, but they have equivelant knowledge to what is taught at the
undergraduate
level, more-so actually, as most undergraduates work with Matlab simulations,
and not real hardware.

> Steve has done a great job here, as usual, in descibing the intellectual
> limitations and character flaws inherent in the LandLine Lid community.

Blow me,

What's a "LandLine Lid?" Sounds like something a CB radio
person might use? 10-4? Good-Buddy?

> Thanks, Steve!

Blow me,

You're welcome.

799. Internet Accessible AR-Cluster

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-26 00:00:00 UTC
From: Ron <no-spam@no-spam.com>
Message-ID: <FtTt4.610$Em5.76829@news7.onvoy.net>
Source record: 14000

You are welcome to connect to the internet accessible AR-Cluster at KC0DJO in Duluth Minnesota.

The IP address is 209.32.226.63

At your first check in you will be asked for your Call, Name and QTH. Please enter your QTH in the form: Chicago IL or Oslo Norway so that we will know where all our new friends are from! You will also be reminded to SET/LOCATION, that's optional but recommended. If you set your location, then the AR-Cluster will calculate beam headings for you to various prefixes. For HELP on these commands you may type

HELP SET/NAME
HELP SET/QTH
HELP SET/LOCATION

To see what you have entered type: SHOW/STATION your_call

You can correct any errors using the SET commands.

For more information on AR-Cluster including a Logon Tutorial and Command List go to this website:

http://www.cestro.com/pcluster/index.shtml

Ideally you should use your logging program to make your telnet connection. Its a huge advantage as then your logging program will monitor the dx spots and alert you to contacts you need.

However, here are very simple instructions for using software already a part of Win95/98:

First connect to your ISP as you normally do when using the internet. Click Start then click Run. In the box enter "telnet 209.32.226.63" (without the quotes of course). Now click OK.

You should now be connected to the KC0DJO AR-Cluster.

Enter your call. If what you type does not display, then you will have to turn on local echo. In the Telnet window click on Terminal / Preferences.. and check Local Echo and then click on OK.

Now proceed as earlier described to sign on.

Try some common commands as:

SH/DX
SH/C
HELP

Welcome to the KC0DJO AR-Cluster.....and 73 de Ron N5IN

As much as I'm interested in what Charles has to say on the subject too, I'm going to jump right in and offer my own response.

I'm not making any bets on the future of Amateur Radio today, other than if it has a future, it's future is digital.

I'd personally like to see what I've wanted to see happen for more than a decade, a radio based *alternative* to the Internet. Charles and I might disagree on what the best way is to get there, but I think we share that vision.

I'd love to be able to equip my car, or my person, with sufficient radio and computing hardware that I can establish reasonable speed IP based network connections with other hams (and perhaps with non-hams) from any point on the surface of the planet.

I think the packet radio experience has demonstrated that VHF/UHF/++ are perfectly technically feasible for building terrestrial radio networks but that it requires levels of commitment and cooperation to actually build anything useful that it's practically quite a difficult job (without an enthusiastic, wealthy and autocratic sponsor).

I'm personally going to be turning my attention to digital comms on HF. I think that's got to be a direction to move to get out of th existing rut. IP/Pactor perhaps, I don't know.

The Internet experience is something we should leverage off: give the people a network and they'll find uses for it. Supplying applications without a network to support them is a waste of time.

regards
Terry

If (and that's a big if) the satellite makes it to its design orbit, then hams
will
have what they need to bypass the thousands of terrestrial stations needed,
and have something more reliable and faster than HF could provide.

I' like to see more ARRL support for microsats, but they've bet the store
on the 3 year old phase-3 attempt.

803. FlexNet memory use

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-26 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <899ut20nfa@enews2.newsguy.com>
Source record: 14004

I moved to a new QTH a couple of months back, and never got around to doing a STAT check on my FlexNet node until today. Here's what I got:

```
=>stat

uptime: 54d,23h; total 90k, max10k, used 3k
po device version txframes rxframes terr rerr rberr ioerr
0 KISS 1.5a 60942 65257 0 0 0
0
1 R:XSCC1 0.19 50222 364941 0 0 0 0
15 SHELL 3.3g:2 52765 50125 0 0 0 0
=>
```

I understand the "90k", but would appreciate info on what the "max10k, used 3k" is about.

The node is currently running a 19.2kb fullduplex KISS serial link to another computer running a BBS program in Windoze, and a single 1.2kb radio port off of an old DRSI PCPA-1 card. I thought I'd do a STAT check as I was about to shut down the node in order to add another radio port. (BayCom)

Ok, I'll bite, but my opinion on this matter is no better than anyone else's. We all have opinions, and we all have dirty socks in the laundry. These generally stink, as we all know.

When looking at this, I prefer to separate the "practical" from the "experimental". The practical stuff will see widespread use; The experimental stuff probably won't, by it's nature. (complicated, expensive, limited utility, and so on.)

I'll stick with the "practical" stuff here. (As I see it.)

1. Large-scale VHF/UHF networks, previously and currently administered and funded as if they were repeater organizations (USA) will come back in a big way. It is now possible to start seriously considering a national VHF/UHF net here in the USA. The following URL gives a few clues as to how this will be accomplished. Unfortunately, I haven't had time to update this page in a while, but still it contains enough info to get the general idea across.
http://www.texoma.net/~n5pvl/serious.htm

2. Point-to-point HF forwarding of @WW packet bulletins will give way to multicast distribution which makes much better use of a lot less spectrum. The present point-to-point stuff (PACTOR, CLOVER, etc.) will still move personal mail and regional bulletins. (@ALLUS, @EU, @TEXAS, etc.) and possibly update requests/replies for @WW stuff missed from multicasts for one reason or another.
http://www.texoma.net/~n5pvl/multi.htm

3. SKYWARN stuff will go over from voice (repeaters) to digital, with each report automatically including position info via APRS for both the spotter,

and the vector from his position to the weather event being reported. The weather events themselves will be displayed on the maps as the system is developed and tweaked over the years. Yes, I know about doppler radar doing the same thing already, but regional doppler radar is not available in all locations, and won't be for some time to come.

Regional and a national SKYWARN APRS display(s) (web-site) will show these WX spots in real-time, automatically making the information available to NWS, FEMA, local government folks, researchers, and interested individuals. This will go far in proving the worth of Ham Radio to anybody clever enough to access a web-site. Great PR, lives saved, and on an ongoing, daily basis.

4. Voice repeaters will still be around, but will slowly change over to digital as opposed to the analog stuff currently in use. Video and data will be available for those not busy driving a vehicle.

5. AMSAT will come into it's own soon after RLV's (reusable launch vehicles) come into common use, cutting the cost of lifting equipment into orbit by a factor of ten or more. Still, AMSATs will have a hard time making a real impact on the total volume of traffic moved for quite some time to come. For the next few decades, I'd be pleasantly surprised to see AMSAT be anything more than an experimental setup used on a token basis as it is today.

6. Internet gateways will come into their own as more clever and less self-defeating applications for them develop. The "LandLine Lid" phenomena will slide off into the obscurity it deserves.

7. Applications utilizing data telemetry (beyond APRS) will become very popular. APRS is just the tip of the iceberg concerning the use of telemetry in digital Ham communications. Eventually, we may see Hams working with NASA as supervisors of robotic exploration vehicles scattered around the solar system as these come into much wider use. (Again, this will spin off of cheap orbital access brought on by the everyday use of RLV's.) To this end, we will eventually see "digital repeater sats" that will propagate sigs beyond Earth orbit to - the rest of the solar system.

Note: Anybody else remember E.E."Doc" Smith's Sci-Fi classic "Venus Equilateral"?

8. Many Hams will install APRS equipment in their vehicles, and thus will ALWAYS know where their teenagers are at any given moment when using the family car, as well as how fast the vehicle is moving. ;-)

There's more, of course, but this post is getting lengthy and I've covered what immediately occurs to me. A good general coverage statement to consider is:

"Hams will use what works well and does what they are interested in doing."

>73, Stewart - N0MHS

Unsurprisingly, we're using them in Georgia. The occupied bandwidth
is 70 kHz. We operate on 100 kHz channel spacings to provide some
guard band. Note that the 219 MHz band allows only digital mode
transmissions, and the bandplan is divided into 10 100 kHz channels.
This is the perfect place to operate the WA4DSY RF modems
(Down East Microwave has the appropriate transverter). The SERA
(Southeast Repeater Association) bandplan for 440 MHz also provides
10 100 kHz channels for operation on that band. The latter doesn't help
you in California, of course.

Then what world are you working in? Most companies use DHCP I suspect
-- it makes administration a lot easier. If you have to change the
default gateway or name servers for your network, you just change
them once at the server -- no need to visit every PC. I even use DHCP
at home to set addresses for my Windows PCs.

pse xcus last

but...

How does Kachina do it? Do they take the data
(digital?/analog?) from the computer (processed)
or from the radio (audio).

Don't they do it at 900mHz spread spectrum...
They also do it over dial up connection.
Surely that's digital, isn't it? Analog
audio along with all the other rotor,
radio, monitoring signals over a
phone line would suck, I think???

I have a 1278B and an Alinco DX-70T running with no "hash" problems. Was this a 2 meter or HF setup and what type of Radio was used.

My Icom 2100H works very well with it on VHF. However, an old Pace Communicator II is interfered with by my PC. This is also the same radio that gets trashed every time I go near a city with more than 3 commerical radios systems in it.

i use a 1270b,no problems into my htx-202,had pk-232,sorry i sold it,i
miss the multi-mode capabilities.
ran 1270b with end user eprom,now use 'ded burn in eprom.so if
multi-mode is not
needed,go for it.
i also use procomm 9k6 tnc.

Steve has forgotten that I'm not one of his buddies at TAPR... ;-)

Get nasty again, Steve, and I'll start talking about "your fellow Ham"
again, and we both know how uncomfortable that makes you!

Steve's juvenile fascination with "nasty language" and porno makes his
attraction to non-Ham Part15 equipment for Amateur Radio quite
understandable. As a "LandLine Lid", Steve has been involved in pathetic
attempts to use Non-Ham equipment (telephone) and PRETEND that what he is
doing was Ham Radio for quite some time. I'm surprised he hasn't pioneered
the introduction of CB radios into the Ham Packet networks as well. That's
next on his agenda, I suppose.

Common decency has always been an essential part of being a Ham, and this is
perhaps what makes Steve feel like such an outsider, compelled to attempt to
use Part15 equipment for Amateur Radio, or to pretend that the telephone is
"advanced packet radio networking".

Har Hawr! Isn't he funny?

Sweet dreams, Steve! - And keep the entertaining, informative posts that so
aptly illustrate the "LandLine Lid" mindset and general level of
intelligence coming!

Message-ID: <951581482.1140987648@news.pacifier.com>
Source record: 14142

First, I apologize for asking a question I'm sure has been asked before, but I haven't been able to find the information looking at past postings.
I am just starting out in packet radio and I am interested in using my computer and it's sound card instead of a dedicated TNC. Could someone please point me in the proper direction for information on how to do this, and what software to use?
My first goal is just to operate on packet radio. After I learn how to use it it might be fun to try writing my own software to do this.
Thanks for your help.

Ted

The nice thing about it, is we have a complete inventory that associates
MAC address and IP address, and combines that with cubicle number,
person name, etc.

We use a Free-BSD server to do it, but Linux would suffice.

I have a couple gadgets from Hawking that connects to your Ethernet
and up to two 56k modems, and performs all Masquerade and DHCP
in a box about the size of a TNC. I opened it up, and it has a 386
chip inside. You can also administer it on a built-in Web server. It's
called an irouter. Pretty neat, but the ping times are pretty slow on
this gadget for some reason. I bought them to use in Ham radio some-
way, and would like to put PeeWee Linux on them. Paid $40 each for
two on eBay... Be neat to combine APRS, DGPS, and Ethernet.

> -Rob-

I was going to guess that is was something common to a particular TNC,
however
with the variety that does not appear to be the case.

In our DX packet network in Northern Minnesota we run 14 MFJ1270C Rev 11's
with
X1J4 and I have not seen a lock up in 5 years. They have been bullet proof.
You can
lock up a node by getting it to execut a Halt instruction, however to do so
requires
the password. We use the 80 character password patch generated password
string,
and each node has a separate one. Our nodes use the default parms which you
will find on the www.sedan.org site.

Prior to using the MFJ1270C's with X1J4 we experienced considerable
difficulty
with the Kantronics Data Engine with BPQ firmware. Random disconnects under
entirely adequate signal conditions. A switch to the 1270C w/X1J4 has made
our
network 100% reliable.

Sorry I can't be of more help

This sounds correct to me. In my "green keys" days, mark was always the higher frequency for RTTY. Typically a capacitor was switched into the oscillator circuitry to lower the frequency for space. Since AFSK Terminal Units had the lower frequency for mark, LSB was used when generating FSK from audio tones.

Thanks, Cecil and Bob.

I have continued to pursue this thread because of my confusion and that of others. It appears that information provided me in Nov 1997, was incorrect. It concerns the "definition" I seek now, as I have reason to believe what was told me in 1997 is incorrect, based on recent research.

I have never had a problem with the technical and arithmetic end of it, but the tradition has tripped me, as it appears that the quote below, that I took as the standard since Nov., 1997, is incorrect.

"In all cases the tune to be played is: The mark frequency shall be the lowest emitted frequency and be considered the published channel."

Any comments relative to the truth of the quote would be appreciated. If it is incorrect, I have a lot of apologies to make to others to whom I repeated the mantra.

824. FT-2600 mic to TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-27 00:00:00 UTC
From: Firefox@Southwind.NET
Message-ID: <002901bf80db$d4212b80$245986d1@default>
Source record: 14010

Has anyone hooked up a Yaesu FT-2600 to a TNC through the mic connection ? I
am need of info on what wires to use from the connector.
The reason I was asking was that the manual (Yaesu) shows the following
pin-outs for the 2600 mic plug....

1 SW 1 (multi function switching)
2 Cloning
3 +9 V
4 Ground
5 Mic Input
6 SW 2 (multi function switching)

No PTT shown

So do I use the mic input and ground only ?
I am planning on using either a KPC-3+ and/or a BP-2M TNC.
I have heard that the data port on the back of some radios doesn't have
enough umph to work a TNC.....

thanks for any help you can provide.

Both responses, below, relative to the statement I quoted in my original post:

"In all cases the tune to be played is: The mark frequency shall be the
lowest emitted frequency and be considered the published channel."

beg the questions:

If the quoted "tune" is true, why does mark in the old rtty jargon mean the higher of two emitted rf frequencies? Why does that tradition, transferred to the newer afsk rtty scenario, mean the higher of two rf emissions? Why does SCS refer to the higher frequency rf Pactor emission as mark? Why do several definitions I found for afsk identify the higher of the two generated rf frequencies as mark?

Can someone refer me to some authoritive source that verifies or belies the quoted "tune"? I am approaching a conclusion, possibly false, that I was lead astray some years ago by an argument from authority. I realize that a definition for a published rf data channel and a tty term may hold little in common and I may be out of line relating the two, too closely.

The www.tapr.org site has a sig just for the Th-D7a.
The sig is also supported by a great searchable archive so just
do a search under subject of PALM.

Also search the aprssig archives for soem extra inoformation.

Two-way radio as it has been known, is on it's way out. Many of the high sites in Atlanta are close to vacant. The only folks who are still on them are the paging services. Just about any site with two-way radio on it is getting more room. In many locations, Nextel has just about wiped out two-way radio.

The last air-disaster we had around here was an A-7 in the 80's which the
pilot aimed at a river-bed and then got out after taking-off from Tinker.
The problem was, the damn plane bounced, and ended up in this ladies
living room. The sad thing was, she was also there watching TV, and
of course did not survive.

The News reporters and TV stations flocked to the site, and found that
none of their scanners were picking up anything. Then it was found that
the Disaster team was using a Cell-Phone (pretty big in them days) to
coordinate with.

After that, everyone started looking into, and buying Cell-Phones for
emergency response. They knew there was a limitation, but they felt it
was adequite for most emergencies. Then a bomber came into town
and blew up the Federal building. Within minutes the Cell-Phone
infrastructure was swamped. Media made it clear to everyone to not
even turn the Cell-Phone on within 5 miles of ground-zero.

It wasn't until FEMA arrived with their satellite dish (this sucker is huge
and takes a Deuce-n-half to haul). They could lay down communications
and get it out of the city and into the worldwide phone system.

I think everyone got the message, and from that time, there is a diversity
of communications equipment. The data terminal being very useful to
cut down voice comms. Push a button and you are "available", "on-scene"
etc.

Hams assisted the Salvation Army and Red Cross, but that was mostly
buddy-comms, or Canteen logistics. Even then it didn't work out too
well, because the downtown area is inter-mod city. Many radios were
useless, except the old 70's style radios which didn't try to receive
every band known to man like most japanese rigs today.

That's a real need today. Hams could provide a wide-band system to
get the comms out of the affected area. Even 10 miles would suffice.

What that means, is emergency communications equipment that can get
data out of the area point-to-point, and then tie back in to the commercial
system (Internet). For example, there is multiple T-1 communications
gear in each skyscraper. All you have to do is vocode telephones onto a

multiplex data-link to any of the skyscrapers, and you have phone systems in place for emergencies. You can string them like the Army strings phones in a war zone. (fast and furious).

I think an excellent solution, is these new 10 Mbps Spread Spectrum gear from Lucent and Proxim. These could handle a couple-hundred data and voice channels. Even the 1 Mbps system could handle 20 phones or data links. Drop the phones, aim the antennas, make the hops needed to get to a T-1, and interface the two systems. Using my imagination, these phones can be wireless (even Ham repeaters) or home style portable phones. The gadget you need to interface with is the PRI. It is basically a channelized T-1 that provides 22 phone circuits. ISP's use these for you to dial-up to the Internet with.

You can call me CB names, but I think this is a valid use of Ham technology and basic infrastructure. I see no difference in a Ham sitting in front of an HF radio, and conducting phone patches, or doing voice-tell relay from radio to a phone. It is all a matter of how you connect to the phone, and not whether we will do it or not.

Yup, on my Ming Dynasty TR7730, 2m sounds so nice and quiet. Whereas
on my HT's that band is intermod central. When did this 'out of band
receive' thing become a must have anti-feature?

That's a constructive proposal. To me, I think to
get people interested, ideally, this kind thing would have both
a 'practical use' and a 'hobby use.'

Do those telescoping masts, that TV Stations use on their
vans ever end up surplus? You know, the gadgets, where
the little dish gets raised up in the air from a van, to talk
back to the station I guess. I assume ideally, you'd have
that or some kind of remote antenna you could hook up, and
then a mountaintop site, with a repeater -- that could link
to somebody's house with a cable modem or something.

I did talk to some hams on wwconverse from Turkey, and they
said that they setup some kind of remote link to the parts
of Turkey that were destroyed by the quake. Not sure what
kind of equipment they used. So, I don't think this kind
of thing is too out of the question.

Me, I'd think maybe little easier would be to setup an 'emergency email'
system -- so that you'd setup a table with a bank of laptops
running on emergency power at the emergency site. And,
then people who had messages to send could sit at one of
the laptops, and type in their message -- which would
then relay out to somewhere that had an internet connection.
Maybe then a printer and a bulletin board could handle incoming
traffic.

If you have a two-meter rig handy, monitor the standard packet freqs one evening for those distinctive BRAAAPS's that 1.2kb packet makes. You can't hear the faster stuff except perhaps as a hissing noise, easy to miss. On the other hand, if there's no 1.2kb activity, there's probably none of the faster stuff either.

145.01
145.03
145.05
145.07
145.09

I'd try 145.01 first.

If all else fails, call the chamber of commerce, ask for contact info for a local Ham club, then ask those folks about local packet activity.

Good luck ...and have fun!

I suppose you "could" call the sites I'm aware of "high level", though in the area I'm speaking of, there are no mountaintop sites. (North Texas) "High level" in this context would generally be 300-400 ft. towers located in slightly hilly, but not mountainous country. These are towers that predate the more recent slew of cellular towers that are still springing up in this area.

The info I obtained came from a discussion with an E.E. who works for a railroad company, and a senior field engineer working for a company who sells a widely utilized IP router. Lots of other outfits out there doing the same thing though, from what I gather. My friend who works for the railroad did not originate the policy himself, but rather described a general trend that his company is following, along with many others across the country.

It's an economy move, more than anything else. Rather than update a large number of existing sites to handle current needs, they are simply putting the bulk of their "backbone" on the net, and only emerging to RF when absolutely necessary...

After all, these are commercial outfits, not Hams, so there is no particular reason or need for them to use Radio unless it is economically advantageous for them to do so.

Since I came up with this info from an employee of a railroad, that might be a good place to start looking in your area. Railroad companies are not, however, the only companies making this move. It was described as a general trend.

I think that railroad companies would be a good place to look though, since their towers "follow the tracks" through many areas where there is low population density. - Those exact places where Hams traditionally have difficulty establishing RF links to hook up one city to another.

Taking full advantage of this opportunity so as to get a good start on a National Packet Network will require (step up on soap-box) a more serious approach in structuring and funding large-scale packet organizations. None of the existing large-scale packet networking organization have, to my knowledge, the "grunt" to fully take advantage of this opportunity.

They're all still set up as if they were local repeater organizations, and as we all know, that organizational model can hardly handle what they have now, much less anything more ambitious and effective.

That's why I have been gently suggesting that this would be a great time to GET SERIOUS.

Can someone with a KAM98 or KAM+ go to 8.42125 MHz LSB and see if they can decode the SITOR (mode B FEC) there? It is from the US Coast Guard and is supposed to be text weather information at certain times. The rest of the time I am guessing the signal is repeated station ID info.

Thing is, although I see my tuning LEDs go rail to rail like I suppose they should, I seldom see the Link/Con light come on and I never see anything that lookslike intelligable data on the terminal program. I am using LAMTOR to try to monitor the weather station xmission.

Any ideas how I might be (mis)using my KAM98? Help?

I am trying to decode SITOR (mode B FEC) with my KAM98 with very little luck. Can someone help me?

I am listening to a nice strong signal at 8.42123 LSB* and have the left and right tuning LEDs lighting nicely. The Rcv light comes on during every data burst, but the Link/Con light comes on very rarely after entering LAMTOR mode and when it does, I mostly get repeated characters in my terminal program (hyperterm). (mostly 'R's) In FEC mode, the Link/Con never comes on and I never see any characters.

If I enter AMTOR mode to monitor, I get a bunch of lines like this:
<FREESIG 0 BY UUUUUUUUUU>
<FREESIG 0 BY UUUUUUUUUU>
<FREESIG 20 GW UUUUUUUUUU>
<FREESIG 18 GW IX:}5EOGYo>
<FREESIG 0 BY UUUUUUUUUU>

Any ideas?

Dave KB5GOG

*that is a US Coast Guard SITOR b-cast station.

Sounds like a job for the ARRL. They're the only ones making money in
Ham radio. They've never been much interested in data though. But if you
want a national network, you are not going to do it without them. What does
the West Gulf director think? What is his budget for this?

Dave,

Most Marine transmissions are done on USB. Change to USB and you can decode.
Also, you probably use use FEC rather than LAMTOR for monitoring these
signals.

I work for a large Aerospace corporation. I've also worked for
Lockheed, and TRW over the last 20 years. The problem is, the corporate
computer networks(thank god they haven't infilitrated our lab network),
are run by the same guys that used to be the mainframe system
administrators. These guys act just like that character from Dilbert -
Norbert: "Denier of Information Services" (the guy that writes Dilbert
used to work for another corporate behemoth - Pac Bell).

So, I'm sorry to say, that is why Dilbert is funny and so popular here
in the USA. I can't say about overseas, but I notice that most of the
replies harping the greatness of DHCP are from overseas. I've got to
say that you guys are living on the fringe of the Internet, and aren't
living in the real world of a critical mass of control freaks; or
possibly the control freaks haven't learned enough to work themselves
into a position to block progress in your society as of yet(it WILL
happen, sooner or later).

It is really amazing that the Internet was able to succeed - the control
freaks really tried to fight it, but were caught with their pants down.
It grew so fast that they weren't able to stop it. They have really
tried to slow it down, but it keeps growing. I good example of an
ignorant control freak caught with her "pants" down is Janet Reno,
who is saying that she can actually do something about "Internet crime"
- what an ignorant computer-illiterate control-freak buffoon she is.
When people like this get semi-computer literate -- LOOK OUT! You know,

we make fun of how paranoid the Chinese government is of the Internet - but there are parts of the US government that aren't much different, really.

Also, please don't try to tell me that you would actually use DHCP in a ham radio network(especially a 1200bps one). I had enough trouble weaning people off of ARP in the mid '90's, please don't get people started on another silly automatic routing/identification standard that would eat up what little bandwidth we have. These standards come from a world of 1Mbps-100Mbps(and higher) communication rates. Please keep your experiments in the third world, where they belong :)

P.S. I bet you are using CORBA down there in Australia, too - right?

847. Kantronics KTU weather station on APRS

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-28 00:00:00 UTC
From: n1naf@mint.net.net
Message-ID: <38ba6561.36933808@news.mint.net>
Source record: 14033

Has anyone put a Kantronics KTU weather station on APRS. If so, how did you do it?

Please send responses to my callsign @ mint.net.

- Mike (N1NAF)

What a total joke things are out here in California. They are currently
redoing the 440 bandplan here, and are doing the OPPOSITE of what they
should be doing. They are going from 25khz to 20khz spacing!!! As
Ren would say, what a bunch of EEEEDIOTS!

You say that the 219 MHz band allows only digital mode
transmissions, and the bandplan is divided into 10 100 kHz channels. Is
this only in your area, too? Or is this a nationwide standard?

Maybe it does to you. Most rational Hams would not even consider the ARRL in
this context. I certainly don't.

FEC and AMTOR on the Kam can decode SITOR. Your problem is the mode. Switch
to USB and you'll be able to decode.

AX.25 is easily the most widespread data protocol for radio amateurs...

But its name is misleading. It should be called LAPB or maybe ALAPB.

852. Squatter's rights on VHF/UHF.

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-28 00:00:00 UTC
From: horseshoestew@my-deja.com
Message-ID: <89erdl$iv5$1@nnrp1.deja.com>
Source record: 14038
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.digital.misc

Myself, and some of the other hams that have started to get back into the hobby have started to notice that the VHF/UHF bands are now basically unused. What I'd like to do(and I'm sure a lot of other technically-astute individuals that we should be trying to get into the hobby)is to use these bands for hi-speed digital communications(56kbps and above). The "band plans" in my area (Southern California) have totally allocated this space to mostly non-digital applications, and to mostly voice-repeater applications. It seems that a select few hams have basically set up their own "personal communications systems" which they hardly(if ever) use. It is my assertion that once a "critical-mass" of "digitally-aware" hams would start to use the VHF/UHF bands, we should be able to squat on unused frequencies, and eventually form our own band-plan. An even better scenario would be to have the FCC issue a "new deal" of frequency allocations - with an emphasis on experimental mode allocations(hi-speed digital communication being one of them), and a de-emphasis of voice repeaters. The fact is - we could form our own "cellular" communication system that would fulfill both the new digital communication needs, and the old voice communications needs at the same time. We should also petition the FCC to allow 100khz/56kbps operations on 6m and 2m - to allow for more efficient use of our bands, and to spur digital experimentation.

If too many of you would argue with this, maybe I should just suggest we disband amateur radio, as it seems it has lost its main purpose (experimentation) - and give back all our frequency allocations, so it would better serve mankind.

Hey, has anyone set up a transverter-repeater in your network?
Especially interesting would be a cross-frequency repeater - which
should avoid expensive filtering requirements.

854. PK-12 loses packets

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-28 00:00:00 UTC
From: pdickson@us.oracle.com
Message-ID: <pdickson-ya023180002802001201530001@newshost.us.oracle.com>
Source record: 14040

I am having major problems getting my PK-12 TNC to work reliably.

- I am sure all connections are correct
- I have tried it on two radios:
Yaesu VX-5R, RCVR-SAVE disabled, Squelch operative. No hardware
squelch connection
MFJ "data radio", with hardware squelch connection. Rcvr runs
"open".
- Received signal strength is S9
- Audio out of the radio looks ok on an oscilloscope, about 1.5v p-p
- Volume control on VX-5R set to 50%
- Have tried two different physical locations, one in car with magmount
antenna and the other at home with external beam.

Symptom: the other end (very strong signal, 5 miles away) sends packets
which I can hear on the VX-5R, but the TNC reports nothing. Putting the
TNC in "WHYNOT" mode shows many packets being rejected for CRC errors (the
"PASSALL" message is displayed). Perhaps one packet in four gets through,
and the larger the packet the greater the problem seems to be. The channel
is not congested.

My primary use of the TNC is in KISS mode under control of the JNOS
software, running TCP/IP. I used a terminal emulator with KISS mode off to
do the WHYNOT test described above.

Needless to say, all the lost packets and resulting retransmissions result
in very sluggish performance and make large transfers impossible. The
SYSOP of the other node reports seeing his end sending packets over and
over with no reaction from my end, which confirms my observation.

Any suggestions what to try next? I was considering a BayCom modem in
place of the PK-12, but then I would have to send back the MFJ radio since
the MFJ does not have audio squelch and the BayCom modem (from
Tigertronics) does not have a hardware squelch-input connection.

>great idea but unfortunately its way too expensive for the benefit.
>A 56 K. half duplex radio link should cost no more than $150.

A 10 watt full duplex 56 kb station costs us about $600 to install.
(The DSY modems will work full duplex.) I don't see any way to
get that cost down to $150 without very large economies of scale,
which the digital amateur radio market does not offer at present.

>Today
>I can purchase a fully assembled 1.2 Mb radio from Slovenia for

>in the 23, 13,9 cm bands.

We built two of these when we first learned of them. At that time we had to
make our own boards from the layouts on the web site (7 boards per transceiver)
and scrounge the parts. That cost us a lot more than $325 each. I understand
that the design has now been condensed to a single multilayer board. I was not
aware that these were being offered W&T for commercial sale, however.

>I made the mistake of buying these as just PC boards and cases so
>now I'm trying to collect all the parts.

Been there, done that. It's hard to get some of the parts here in the states.

>http://www.hamradio.si for more information.

I checked the site again. I haven't found the order page for the turnkey
$325 systems. Can you give a more precise URL?

>once you've read up on some of the ideas, there is no reason why
>we couldn't develop a BPSK or QBPSK radio using the same techniques
>as the Slovenians did back in 1995. I can't do it because I
>know only enough about RF modulation techniques to be dangerous.
>I can however commit to working with others to build infrastructure

>in eastern Massachusetts if someone could design the radio.

BPSK is a bandwidth hog, but we have surplus bandwidth available at
23 and 13 cm, so that's not as big an issue as we faced on 219 MHz and
70 cm (where we chose MSK to stay within the FCC regulations on
occupied bandwidth for those bands). The big problem we found when
testing the Slovenian equipment was multipath. It's a killer at high speeds.

In our terrain, we rarely have true line of sight paths. 56 kb MSK works
Ok if we're careful, but the faster BPSK doesn't cope as well. You have
to design your paths the way you would for reliable point to point microwave
links. That limits the topology of the network when you have to deal with
the practical site acquisition problems faced by amateurs. (We don't have
eminent domain, or infinitely deep pockets, so we can't always get the
locations we may need the way the telcos can.)

I have been hoping that the SS work being done by TAPR would be a solution
to that problem. (SS is naturally robust against multipath, and a raking receiver
design can make it more so.) But progress on that front has been slow. I also
have some practical implementation issues with SS in amateur networks.

The high sites to which we can gain access are usually crowded with high
power commercial transmitters, and by nature the SS receiver has to have
a very broad front end. So I'm concerned about fundamental overload problems
at those critical relay sites. As it is, we have to use cavities in front of our 56 kb
systems to deal with the issue. The 56 kb system is narrow enough so that
works. More complex (and expensive) front end filtering would be needed for
the wider signals.

There are a lot of practical issues like this which have to be considered
when designing a network to service more than a few square miles. Our
network presently covers an area in excess of 10,000 square miles. I frankly
don't think we could manage to get, or maintain, enough sites to cover that
territory at a much higher speed. It is a strain just to maintain what we have.

>while we are at it, we should also be developing full duplex backbone links
>and possibly full duplex last mile because half duplex just doesn't
>work beyond one or two hops and we need to span 30 or 40 hops.

Yes. We can support full duplex, and our sites generally use RF modems
on different bands for alternating backbone hops. That way they don't
interfere with each other, and the switch site can stream in both directions
along the backbone at the same time. Most of the users are still running
half duplex, but we have made provision for them to operate crossband
duplex. This eliminates the need for an expensive repeater grade in band
duplexer at each user's site. We don't have many users taking advantage
of that though. It does require a receive converter in addition to the normal
transverter, and a pair of antennas. That's still cheaper than a duplexer,
but most users don't perceive enough benefit to do it.

>duplexer at each user's site.

I should say that I completely miss the basis for the claim of needing full
duplex because of a certain number of hops, and the need for 30-40 hops,
but aside of that: in Europe we usually use in-band fullduplex for links,
and DF9IC has designed a couple of easy-to-reproduce duplexfilters for that
purpose. They are available ready-made from some amateur and commercial
sources as well, usually at affordable prices.

Full-duplex to the user is normally not feasible (a separate transceiver at
the node side for each user!?), but some nodes use a hybrid system:
full duplex system including duplexfilter at the node, halfduplex-split
system at the user side. node can transmit data all the time, users
transmit one by one.

Channel access can be controlled by bit-repeating the uplink to the
downlink at the node, which has the advantage of allowing user-user
connects, or by using DAMA or OPTIMA, which allows for better throughput
but needs fast user transceivers.

If the technical quality of each link is so good that you only get only a few single bit errors each hour, you can use simple bit regeneration at each hop, then there is no need for individual acknowledgement at each hop. The high reliability of each hop is the case with Frame Relay, in which case you only have end to end acknowledge is required, possibly with a very large window size.

You can of course improve the quality of each hop by using strong FEC, thus reducing the number of retransmissions required, but this also increases the propagation delay, since a whole frame must be received, the ECC applied to the data and a new frame must be generated from the _corrected_ data, thus much more time is required than in simple bit regeneration.

With 30 - 40 hops, you can reach about 1000 km assuming 30 km hops, which is about the practical maximum for high speed communication in all weather conditions.

Dear Tester & Measurer,

We own and use a Philips Logicanalyzer PM3585.
Unfortunately Philips sold their Test&Measurement Division completely to
Fluke, and Fluke dropped support of the Logicanalyzers immediately after
their purchase.
Today (Feb. 2000) there is no support neither from Philips nor from Fluke.
I asked them both, but they told that they have physically shreddered all
parts for this product?!
What we are searching for is disassembler software for the Intel 80x86 line
of processors.
What we have is disassembler software for 8051 microcontrollers.
Maybe someone has the ones we are searching for and wants the ones we have.
Maybe someone has the ones we are searching for and dont want ours.
Anyway: We need disassembler software for 80x86, 80286, 80386 and/or 80486
processors, so if you have or know who has, PLEASE mail to marquardt@alc.de

Best regards
Juergen Marquardt

Ok, but I did not/do not see the relationship between fullduplex and having
acknowledgements at each hop... these are completely ortogonal issues.

30 km hops is awfully optimistic. We're doing extremely well if we can get
10 km hops and three km is much more likely. So 30 hops is more like
100 to 300 km. Okay for regional networks and probably more suited
for digital voice networks as replacements for the current repeater
environment.

understood. I think the way to bring down the price is to look into reusing components and designs available in the commercial realm. http://www.mxcom.com/products.htm has listings for transmitter ICs, receiving ICs, as well as high-speed Gaussian minimum shift keying modems.

http://www.maxim-ic.com/showcase_2463.htm
is a overview description of a high-speed MSK transceiver based on a single chip.

my point is that it's probably difficult but not impossible to reach the $150 price point. Compromises are inevitable but not a project killer.

>>http://www.hamradio.si for more information.
> I checked the site again. I haven't found the order page for the turnkey

http://lea.hamradio.si/~s53rm/ send email to sine. he's awfully slow responding so don't panic if you don't hear something back for a few days.

> The big problem we found when
> testing the Slovenian equipment was multipath. It's a killer at high speeds.

it's a killer no matter what speed you operate at. It's just that slower speeds make packet so boring that you never get the point of noticing the multipath.

we need to figure out what the commercial folks have done for multipath and adapt their techniques to the amateur world. They live in the same RF spaces we do and the only difference is they have money and users interested in using the network.

> In our terrain, we rarely have true line of sight paths. 56 kb MSK works

this is abundantly clear to me and to others. The amateur radio model of putting up a transmitter at home and establishing contact with lots of others independent of any intermediary infrastructure just doesn't work in networking.

> I have been hoping that the SS work being done by TAPR would be a solution

> works. More complex (and expensive) front end filtering would be needed for
> the wider signals.

good points. I was wondering about the same myself. It seems to me that it will
also depend on the modulation techniques used. From my admittedly weak understanding
of spread spectrum, it seems like DSSS would be rendered nonfunctional in the
presence of point RF sources and inter-mod. One would probably need a
different technique for operating in high RF density environments.

> Yes. We can support full duplex, and our sites generally use RF modems
...
> but most users don't perceive enough benefit to do it.

interesting. I guess if all you are running is DX cluster or
APRS you don't need high-speed or full duplex. I guess we need to
find the magic application set that will turn folks interest
to supporting the networks and participating in their growth.

> sources as well, usually at affordable prices.

I assert that full duplex is required because of the way half duplex
links increase latency and reduce effective end to end bandwidth.

In a single hop, a half duplex link cuts the available bandwidth in half
increases latency by the time it takes to retransmit the packet. In two
hops, on half duplex links, the bandwidth is cut to one-third and the latency
increases by two packet transmit times. I think you can expand the series
from here. Full duplex links eliminate that and keep latency to a minimum.

theoretically, if you use a large packet transmit window and nodes that
act as store and forward switches, you might be able to approach 30 percent
of a full duplex link's capacity but it's really messy.

The reason I assert the need for 30 to 40 hops is that we are not going
to bridge any great distances with a single hop. If I want to send a packet
between Boston and New York, it's going to take a lot of hops.

> Full-duplex to the user is normally not feasible (a separate transceiver at
> the node side for each user!?), but some nodes use a hybrid system:
> full duplex system including duplexfilter at the node, halfduplex-split
> system at the user side. node can transmit data all the time, users
> transmit one by one.

what you suggest is a reasonable compromise between end to end full duplex
and expensive end-user equipment.

875. Packet for control towers (Was: Re: Internet over packet?)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-29 00:00:00 UTC
From: Mooneer Salem <mooneer@earthlink.net>
Message-ID: <%bRu4.1004$PY4.56090@newsread2.prod.itd.earthlink.net>
Source record: 13962

I know the perfect idea for this (might not even require full-duplex or high speeds for it
either).

How about using packet radio as a replacement to airport control towers? Each airplane participating would have some type of transceiver with a TNC attached
to it and a laptop computer. The laptop computer would also be connected to the
aircraft's autopilot. Every control tower would have a similiar setup, except that
there's no autopilot and the laptop is replaced with a mainframe or a server cluster.

The airplanes would transmit the coordinates of planes within a 10-mile radius or so
once in a while, allowing the nearest traffic control "node" to perform collision avoidance.
At the nodes, the flight plans for each flight could also be stored digitally, allowing the node
to give instructions to the aircraft as to how fast and what direction to fly.

Eventually this could be extended to allow the nodes to control takeoff and landing,
possibly with a full-duplex link.

Any suggestions?

-Mooneer

Yup, for Windows, run the sv2agw software. There's a shareware
fee for ip, but for just receiving plain AX25, which is what APRS,
it's free. I forget the exact url, but run sv2agw, through
a search engine. Your sound card should be fine -- it seems
to work with basically any sound card out there at 1200 baud.
No TNC required.

Thanks...

Yes, check out the Kenwood TH-D7A, it looks really cool; it is dual band(2m/70cm), and it has a builtin TNC with 1200/9600bps modems:

882. Re: APRS config for KPC-3+ and Tripmate?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-02-29 00:00:00 UTC
From: Glenn Cummings <kg7il@foxinternet.net>
Message-ID: <38BC91CA.432FD884@foxinternet.net>
Source record: 13969

Actually no modification is necessary with the newer ROMs in the KPC-3+.
It supports a GPSINIT string which can be the required string for
initializing the Tripmate: ASTRAL

I have a file that can be sent to the KPC-3+ to fully configure it for a
power-up with the Tripmate. I just have to find it.

The only 'mod' that I needed to make was a provision for the 6 volts to the
Tripmate.

The other 'mod' that may be helpful is a relay on the data line that opens
with the ignition off and closes with the ignition on. This will exploit a
KPC-3+ feature: See my web page
http://kg7il.foxinternet.net/ham/aprs/swdata.htm for more information.

I think that it would pretty easy to bundle your radio (HandiTalki), power
adapter and cables in a box.
I was able to tuck the equipment under my console tray in the empty space
without a problem. This wasn't too portable however.

Hope this helps

First of all, I doubt your problem is with the PK-12.

Some questions:

Do you have good voltage into your PK-12?

What is this "other station" you are talking about - is it a know good working staton?

What TxDelay is the other station using?
(However, the fact that you say that longer packets are more unreliable, makes in unlikely that it IS a problem with the other station's TxDelay).

Have you tried plugging in a compatible TNC? A PK-88 would probably have the same pinout(although I'm not positive about this). I'm sure you can find a local ham in your area to lend you a known good working TNC for a day or two to positively rule out that the TNC is the problem. I bet when you wire up another TNC, you'll have the same problem.

Have you tried getting rid of that JNOS POS? Try just hooking up to the TNC with a simple Windows terminal program.

You should be able to wire up a loopback connector to the TNC's radio connection port, and send yourself messages - that should prove for sure that your TNC is OK.

Once again - I really doubt that the TNC is the problem.

I have 3 PK-12's.. working fine with no problems...

turn PASSALL ON and watch the code that comes in... see what it looks like... the inbound audi may not be loud enough.. or too loud.... many things... but that might show you something....

886. Experimental project for a better airport control tower?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-01 00:00:00 UTC
From: Mooneer Salem <mooneer@earthlink.net>
Message-ID: <Mu_u4.2623$PY4.103514@newsread2.prod.itd.earthlink.net>
Source record: 13972

I know the perfect idea for increasing the use of amateur radio
(might not even require full-duplex or high speeds for it either).

How about using packet radio as a replacement to airport control towers?
Each airplane participating would have some type of transceiver with a TNC
attached to it and a laptop computer. The laptop computer would also be
connected to
the aircraft's autopilot. Every control tower would have a similiar setup,
except that there's no autopilot and the laptop is replaced with a mainframe
or a server
cluster.

The airplanes would transmit the coordinates of planes within a 10-mile
radius or so once in a while, allowing the nearest traffic control "node" to
perform
collision avoidance. At the nodes, the flight plans for each flight could
also be stored
digitally, allowing the node to give instructions to the aircraft as to how
fast and what direction to
fly.

Eventually this could be extended to allow the nodes to control takeoff and
landing, possibly with a full-duplex link.

Any suggestions? Would it be possible to develop this type of system
on the ham radio bands? (I'm in no way affilated with any airport or company
but
I want to see something that will get interest in this hobby, and this might
be
the spark for the engine)

-Mooneer

Do a net search on FANS CNS/ATM... or FANS1/A for info on datalinks used for air traffic control applications. Try searching on ACARS for airline operations center datalinks... Search on TCAS and ETCAS for collision avoidance systems. Lots going on out there.

So I guess I'm a bit too late on that idea eh? According to the stuff I found on the
Internet about CNS/ATM, these systems still require a person at air traffic control:

http://www.iata.org/fsg/concept.htm
"Airlines and Air Traffic Management agencies will both be hesitant to invest in the necessary equipment until they are convinced that their costs can be recovered within a year or two. Who will have the vision to make the first move?"

An alternative system can be made with a laptop computer with a soundcard and
the aircraft's radio system. And there are inexpensive server clusters that can be made
with Linux and other Unix variants that reduce the cost for the ground units.

And each aircraft can act as a sort of "repeater" which transmits coordinates of nearby planes
and can possibly tell them how far back they should be, their altitute etc without needing
to contact a ground unit.

Or maybe I'm getting a little too ahead of myself and should just assume CNS/ATM is
a better system?

That has already been done. I don't know if the systems are ready for
real-life use, but the people aren't. It takes some attitude adjustment to
switch from the current system to a system like that.

But it has been on documentary TV programs.

Of course they don't use a TNC and a laptop computer. Nobody would want
such unreliable consumer-grade equipment near an air traffic control
system.

Another one having trouble differentiating between Ham and Non-Ham.

To expect Ham Radio to "compete" with commercial outfits with their deep pockets is stupid. To criticize Ham Radio for not doing so is *particularly* stupid.

In some cases, Hams end up pioneering new techniques and ideas that commercial outfits are too stodgy to consider. This never is done, in my experience, by "Hams" that are determined to run down and denigrate Amateur Radio. All that these fools generally have to contribute is hot air that has a rather bad smell about it.

> How about using packet radio as a replacement to airport control towers?

The U.S. is going to a Free-Flight system. In this system, the biggest obstacle to increased traffic flow, is the antiquated FAA system from the 40's. Free-Flight
abandons the air-route system, and aircraft can fly any route, any altitude they want. Two things make this possible, TCAS and datalink. All aircraft have a picture of surrounding traffic and intentions.

The control tower on the runway will probably be needed to keep these idiots from smashing into each other, or trying to land during a thunderstorm and dumping bodies all over the pavement (can you say American Airlines).

> The airplanes would transmit the coordinates of planes within a 10-mile

The pilot only needs to know what traffic is near their altitude, or ascending or descending through it. In a dense environment, the co-pilot is going to be quite busy sorting the traffic for the pilot. Generally speaking, flight crews
are creatures of habit. They generally fly non-manuevering straight-lines, and use fuel-flow in most of their major decisions. It's really not that hard to avoid conflict traffic, but in a dense environment, this imaginary bubble around the aircraft is hard to maintain. I was a crew-member on AWACS many years ago (retired in 93) and we tried to set-up an orbit between Miami and the Bahamas. We actually had to use banks past 30 degrees to twist and turn through all the traffic. Our goal was to use a bubble around the plane where no other aircraft could see us. Well after just an hour, we banked hard to avoid one airplane only to be heading towards another, so we rolled out between it and another aircraft, and sure enough, one of the airlines saw us and advised Miami center they were taking evasive maneuvers, as they had a plane coming at them. Then other airlines wanted to know his position, and all hell broke loose. We finally had to check-in with Miami and advise our intentions, so we got the hell out of there pronto. Just an example of how hard it is when the numbers of airplanes goes up, and only pilots, not ground personnel are in charge :-)

892. What is APRS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-01 00:00:00 UTC
From: Ian Wade <Ian.Wade@care4free.net>
Message-ID: <UcPvzZA7GRv4EwzW@care4free.net>
Source record: 13978
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Several people have asked lately about APRS. Here is a brief intro:

~~~~~~

====================
INTRODUCTION TO APRS
====================

What is APRS?

APRS is short for Automatic Position Reporting System, which was
introduced by Bob Bruninga, WB4APR, at the 1992 TAPR/ARRL Digital
Communications Conference. Fundamentally, APRS is a packet
communications protocol for disseminating live data to everyone on a
network in real time. Its most visual feature is the combination of
packet radio with the Global Positioning System (GPS) satellite network,
enabling radio amateurs to automatically display the positions of radio
stations and other objects on maps on a PC. Other features not directly
related to position reporting are supported, such as weather station
reporting, direction finding and messaging.

APRS is different from regular packet in several ways:

* It provides maps and other data displays, for vehicle/personnel
location and weather reporting in real time.

* It performs all communications using a one-to-many protocol, so that
everyone is updated immediately.

* It uses generic digipeating, with well-known callsign aliases, so that
prior knowledge of network topology is not required.

* It supports intelligent digipeating, with callsign substitution to
reduce network flooding.

* Using AX.25 UI-frames, it supports two-way messaging and distribution
of bulletins and announcements, leading to fast dissemination of text
information.

* It supports communications with the Kenwood TH-D7 and TM-D700 radios,
which have built-in TNC and APRS firmware.

Conventional packet radio is really only useful for passing bulk message
traffic from point to point, and has traditionally been difficult to
apply to real-time events where information has a very short lifetime.
APRS turns packet radio into a real-time tactical communications and
~~~~~~

display system for emergencies and public service applications.

APRS provides universal connectivity to all stations, but avoids the complexity, time delays and limitations of a connected network. It permits any number of stations to exchange data just like voice users would on a voice net. Any station that has information to contribute simply sends it, and all stations receive it and log it.

APRS recognizes that one of the greatest real-time needs at any special event or emergency is the tracking of key assets. Where is the marathon leader? Where are the emergency vehicles? Whatï¿½s the weather at various points in the county? Where are the power lines down? Where is the head of the parade? Where is the mobile ATV camera? Where is the storm?

To address these questions, APRS provides a fully featured automatic vehicle location and status reporting system. It can be used over any two-way radio system including amateur radio, marine band, and cellular phone. There is even an international live APRS tracking network on the Internet.

APRS Features

APRS runs on most platforms, including DOS, Windows 3.x, Windows 95/98/2000/NT, MacOS, Linux and Palm. A new version for WinCE is due for release soon.

Most implementations on these platforms support the main features of APRS:

* Maps -- APRS station positions can be plotted in real-time on maps, with coverage from a few hundred yards to worldwide. Stations reporting a course and speed are dead-reckoned to their present position. Overlay databases of the locations of APRS digipeaters, US National Weather Service sites and even amateur radio stores are available. It is possible to zoom in to any point on the globe.

* Weather Station Reporting -- APRS supports the automatic display of remote weather station information on the screen.

* DX Cluster Reporting -- APRS an ideal tool for the DX cluster user. Not only is it possible to see all DX spots on the map, but by operating in the monitor-only mode, the overall packet load on the DX cluster is reduced. This is a benefit to everyone on the channel.

* Internet Access -- The Internet can be used transparently to cross-link local radio nets anywhere on the globe. It is possible to telnet into Internet APRS servers and see hundreds of stations from all over the world live. Everyone connected can feed their locally heard packets into the APRS server system and everyone everywhere can see them.

* Messages -- Messages are two-way messages with acknowledgement. All incoming messages alert the user on arrival and are held on the message screen until killed.

* Bulletins and Announcements -- Bulletins and announcements are addressed to everyone. Bulletins are sent a few times an hour for a few hours, and announcements less frequently but possibly over a few days.

* Fixed Station Tracking -- In addition to automatically tracking mobile GPS/LORAN-equipped stations, APRS also tracks from manual reports or grid squares.

* Objects -- Any user can place an APRS Object on his own map, and within seconds that object appears on all other station displays. This is particularly useful for tracking assets or people that are not equipped with trackers. Only one packet operator needs to know where things are (e.g. by monitoring voice traffic), and as he maintains the positions and movements of assets on his screen, all other stations running APRS will display the same information.

Where to hear APRS transmissions

One of the biggest benefits of APRS is that it only uses one frequency to work on -- everyone shares it. In North America, this is 144.390 MHz. In the United Kingdom and several European countries it is 144.800 MHz.

Where to find out more about APRS

These web sites have a wealth of information on APRS, including documentation and sources of software:

Yup,

Two of them I know of - both built by Kenwood. An HT (TH-D7) and a mobile rig (TM-D700). Information on either can be found at the Kenwood amateur site.

Full duplex does nothing to reduce latency. The full frame still has to be
received, checked, and only then retransmitted at each hop. If you discard
notions of packet store and forward and use a simple bit regenerator, then
you do reduce latency. That works fairly well on paths with very low BER,
but unless the links are nearly perfect, a cascade of multiple links gives
you an end to end BER which will almost guarantee an unusable path.
FEC at each link can help, but then your latency returns.

The only advantage full duplex buys you is that you can have independent
data streams in both directions at the same time. That roughly doubles
effective link capacity, but at the cost of using *two* radio channels instead
of one, so you haven't improved your bits/Hz at all.

Well, in theory you could, when both links have the same bitrate and
the outgoing link is idle, start repeating the incoming frame after the
header has been received and it can be determined on what outgoing link
it has to be sent. The frame would then go out with only a header delay,
instead of a full packet time delay. When the incoming frame turns out
to be bad at the CRC check, the outgoing frame can be ABORTed.

Ethernet switches commonly do this. I have never seen packet radio node
software claiming to do this. Probably because it adds extra complexity
and will not work that well anyway.
(it requires an idle outgoing link, same or lower outgoing bitrate, and
mostly errorfree frames to be effective. but fullduplex is not required)

Rob

Paul,

I have experienced exactly the same problem with the PK-12. In my case it seemed to be caused by the sending station having a long AXDELAY setting. Anything over about 700mS and I found the PK-12 just couldn't decode the subsequent packet. (PK-232 users also seemed to have problems with receiving long preambles). I have not yet found a solution apart from getting the other station to reduce the axdelay (or going back to my old MFJ-1270).

901. Re: APRS config for KPC-3+ and Tripmate?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-01 00:00:00 UTC
From: Glenn Cummings <kg7il@foxinternet.net>
Message-ID: <38BDD892.CC4F8FDA@foxinternet.net>
Source record: 13987

And there is even more. I powered the KPC-3+ with 6 vdc and moved a few of the jumpers to provide 6 vdc power input to both the TripMate and the TNC. The power for the TNC can be applied to the pins of the KPC-3+ connectors on the back of the TNC.

This, with a little bit of wiring withing the backshell of the can clean up the wire mess. I have a pigtail I made that goes between the TNC and Tripmate. It has a DB25 to mate with the TNC and a DB9 that mates with the TripMate. There was adequate (but tight) room to work the crossovers and such. The DB25 backshell has a coaxial power jack (for the power) and two small wires to a connector for the ignition switched relay connection. I was able to find a flea relay that fit in the back shell as well. (jumpering the connector makes it operable as is)

None of this causes any problems when I run it in the shack. I just leave the wiring, connectors and stuff in the car, removing just the TNC. In the shack I have power and my mating connectors. The radio connector, the DB9 has a RJ-11 jack which is wired to the mic/spkr connections (as well as the resistor required by the Yaesu HT).

You can probably read through the back pages of the manual and figure it out. I don't remember offhand, but I could look if you are interesed.

I was really impressed with the TNC's flexibility. I even did a paper exercise to see how I could control external devices in the car by connecting remotely. Never thought of anything useful enough to execute the plan tho'.

I searched for the config file that I knew I once had but I guess I'll have to recreate it. I must have lost it during a rebuild of my PC.

Hope this quickly written description is more helpful than confusing. (I would almost have to reverse engineer it to document it). I should probably write a clear description for my web page and include diagrams. Ah, where is the time?

902. Help with MFJ 1278 Hash?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-01 00:00:00 UTC
From: Roland <lroland@teleport.com>
Message-ID: <Xilv4.29631$yn3.213841@news1.teleport.com>
Source record: 13988

Has anyone solved the noise problem I encounter with my MFJ 1278? Mine is quiet below 30 meters but terrible on higher bands. The noise is there even when I disconnect the cables from my radio (TS140). I've tried the simple solutions like toroids on the cables, scraping paint from the cases to ensure an electrical connection and grounding the case. I use it mostly on cw so can't just turn down the volume (it doesn't copy cw well except on strong signals.) Any ideas will be appreciated. Considering what I spent on this thing, I'd like to get some use out of it.
Thanks /John

How to turn $6 into $50,000!-Or more!!-It 100% works!!!
READING THIS COULD CHANGE YOUR LIFE:

This really does work if you give it a honest try!

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I though, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00.
Well, GUESS WHAT!!... Within 7 days, I started getting money in the mail! I was
Shocked ! I figured it would end soon, but the money just kept coming in. In my first
week , I made about $25.00. By the end of the second week I had made a total of over
$1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now
my fourth week and I have made a total of just over $42,000.00 and it's still coming in
rapidly.
It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, why it works Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.

I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!

Suggestion: Read this entire message carefully! (print it out or download it). Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage)

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.
Here are the 3 easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." "Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery).
Next, place one paper in each of the 6 envelopes and seal them, MAKE SURE THAT THERE ARE ENOUGH STAMPS ON YOUR ENVELOPES. You should now have 6 sealed envelops, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill.
What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL!
You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal!

Mail the 6 envelopes to the following addresses:

#1) William Rosser - 254 Getzville Rd. Amherst, NY 14226
#2) Rae Patterson - 150 Hauli St. #150 Wailuku, HI 96793
#3)Connie Wrenn - 111 Chesterfield Dr. Elizabeth City, NC 27909
#4)Christopher Petersen - 222 Haulani St. Pukalani, HI 96768
#5) GERALD R. DE CROCE- 2 HERITAGE CT. MORRIS PLAINS,NJ 07950
#6) Alex Beltran - 6650 Hogan Dr., Sacramento, CA 95822

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.
STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups or emails, (I think there are close to 50,000 groups) All you

need is 200, but remember, the more you post, the more money you make!
**EVERYBODY AROUND THE WORLD CAN DO IT, BUT REMEMBER TO PUT
ENOUGH STAMPS ON YOUR ENVELOPES!!!!!**

This is perfectly legal! If you have any doubts, refer to Title 18 sec.
1302 -&- 1341 of
the Postal lottery laws. Keep a copy of these steps for yourself and,
whenever you
need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the
honesty and integrity of the participants and by their carefully adhering to
the directions. Look at it this way. If you are of integrity, the program
will continue and the money that so many others have received will come your
way.
NOTE: You may want to retain very name and address sent to you, either
on a
computer or hard copy and keep the notes people send you. This VERIFIES that
you
are truly providing a service. (Also, it might be a good idea to wrap the $1
bill in dark
paper to reduce the risk of mail theft.) So, as each post is downloaded and
the
directions carefully followed, six members will be reimbursed for their
participation as a
List Developer with one dollar each.
Your name will move up the list geometrically so that when your name
reaches
the #1 position you will be receiving thousands of dollar is CASH!!! What an
opportunity for only $6.00 ($1.00 for each of the first six people listed
above). Send it
now, add your own name to the list and you're in business!

--------DIRECTIONS--------FOR HOW TO POST TO NEWSGROUPS--------------
Step 1) You do not need to retype this entire letter to do your own
posting. Simply put your cursor at the beginning of this letter and drag
your cursor to the bottom of this document, and select 'copy' from the edit
menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the 'edit' menu select 'paste.' This will paste a
copy of the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do
your postings in different settings, you'll always have this file to go back
to.
Step 4) Use Netscape or Internet explorer and try searching for
various newsgroups (online forums, message boards, chat sites, discussions).
Step 5) Visit these message boards and post this article as a new
message by
highlighting the text of this letter and selecting paste from the edit menu.
Fill in the
Subject, this will be the header that everyone sees as they scroll through

the list of
postings in a particular group, click the post message button. You're done
with your
first one!
Congratulations THAT'S IT! All you have to do is jump to different
newsgroups and post away, after you get the hang of it, it will take about 30
seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!

BUT YOU HAVE TO POST A MINIMUM OF 200**
That's it! You will begin receiving money from around the world within days!
You may
eventually want to rent a P.O. Box due to the large amounts of mail you will
receive.

------------------------------Now the WHY
part--
Out of 200 postings, say I receive only 5 replies (a very low example).
So then I made $5.00 with my name at #6 on the letter. Now, each of the 5
persons who just sent me $1.00 make the MINIMUM 200 postings, each with my
name at #5 and only 5 persons respond to each of the original 5, that is
another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name
at #4 and only 5 replies each, I will bring in an additional $125.00!
Now, those 125 persons turn around and post the MINIMUM 200 with my name
at #3 and only receive 5 replies each, I will make an additional $625.00!
OK, now here is the fun part, each of those 625 persons post a MINIMUM 200
letters with my name at #2 and they each only receive 5 replies, that just
made me $3,125.00!!!! Those 3,125 persons will all deliver this message to
200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625.00! With an original investment of only $6.00!
AMAZING!
When your name is no longer on the list, you just take the latest posting
in the newsgroups, and send out another $6.00 to names on the list, putting
your name at number 6 again. And start posting again. The thing to remember
is: do you realize that thousands of people all over the world are joining
the Internet and reading these articles everyday? JUST LIKE YOU are now!!

So, can you afford $6.00 and see if it really works?? I think so

Remember, play FAIRLY and HONESTLY and this will really work.
GOOD LUCK!!!!!!!!!!!

"Hard work beats talent, when talent doesn't work hard"

This might even work, if there is a _separate_ header-CRC immediately following the header, in which case the validity of the header can be checked before doing the routing decision. Doing the routing decision before it is known to be valid will cause a lot of spurious messages propagating through the network and in worst cases, new undetected errors can further modify the header, creating a message storm, which (hopefully) dies away.

>When the incoming frame turns out
>to be bad at the CRC check, the outgoing frame can be ABORTed.

And when do you know that the frame is bad ?

If individual byte parity bits are used, this would make sense, but if CRC frame type is used, the bad CRC is known when the whole frame has been received and assuming a processing delay/buffering equal to the header size, only about the same number of bytes would be cut off from the end of the retransmission as there are bytes in the header. In a multi-hop system, the frame would only gradually be shorted from the back end, until only the header is left, when the propagation is finally killed.

In protocols without separate header CRC, you should not make _any_ decisions based on the unverified header or message frames that report frame CRC errors (which likely are in the data part, but could be in the header). Thus, e.g. in AX.25, you can not send back some NAK style message, which would speedup retransmissions, since you do not _reliably_ know to whom to send that message and thus have to wait for the transmitter to timeout.

Hi Gang,

Since I haven't had much of a turnout on this last set of estate auctions, I'll tell you about it once more. I have the 1st and 3rd editions of Reference Data for Radio Engineers from the 40's, Gernsback's Alternating Current for Beginners and the first 4 years of Ham Radio Horizons. Opening bids are $4.99 and down. See them at:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=radio_randy

As in all my estate auctions, the proceeds are being forwarded to the widow. Thanks again for looking.

73, Radio Randy

IP has this. But amateurs don't want to route IP.

>>When the incoming frame turns out
>>to be bad at the CRC check, the outgoing frame can be ABORTed.

>And when do you know that the frame is bad ?

The frame is bad when its CRC does not check out as valid.
You are right that this is late in the packet. Ethernet switches survive
on the assumption that most packets have a valid CRC. This is more often
true on ethernet, because there is separate collision detection (that does
not rely on bad CRC to detect collisions), and there is less noise.

But still, many switches have some "intelligence" that disables the fast
mode for some period of time when a certain error threshold is exceeded.

news:38BD2B9A.574184D5@IEEE.org...
> >
> > To expect Ham Radio to "compete" with commercial outfits with their deep
> > pockets is stupid.
>
> My point exactly.

My point was that negative and negative-sounding comments about Amateur Radio are something we should studiously avoid, particularly on any international forum such as this newsgroup.

Not only do the non-hams take comments of that type quite seriously, but it also encourages idiots like the "Ham" on this reflector who recently advocated that we abandon common decency (content restrictions), cooperation with the rest of the world's Amateur Radio organizations, and the use of Radio itself in order to pursue some petty personal goal that is obviously not appropriate within the context of Amateur Radio.

That person displays a lack of respect for both Amateur Radio and his fellow Hams that has no place within the Amateur Radio community, and much of his ignorant attitude stems from the readiness of most advocates of high-speed packet and tcpip to denigrate the hobby and it's participants as a "justification" for their destructive, ignorant, antisocial behavior. Advocates of most other aspects of the hobby appear to get along just fine without such negativity, and cannot be expected to have much respect for it, or those who perpetuate it.

In the face of such negativity, such moral and intellectual bankruptcy; Our best course as Hams is to develop a "zero tolerance" attitude toward those who seek to promote and perpetuate such negativity within the hobby, especially in cases where that unthinking negativity is expressed in international forums such as this one.

Once a few idiots have been "weeded out", I believe that more decent, intelligent Hams will discover that there is no need to attempt to undermine the entire hobby in order to advocate either high-speed packet OR tcpip. In fact, they may very well discover that dropping the ignorant, negative, antisocial attitudes was the best move they ever made in promoting these.

A great number of Hams are put off by the negativity and ignorance now closely associated with both high-speed packet and tcpip advocates, and because of this (duh!) these folks have not made a fraction of the progress they could have by now. They do not show respect, and so they also do not receive it.

Since most outspoken advocates of high-speed packet and/or tcpip are apparently too stupid to figure this out for themselves, we can best assist them in their purpose by refusing to tolerate the ignorance, lack of respect for their fellow Hams, and general negativity they have grown so dependent upon in their alleged "thinking".

Many participants here appear to think that I have something "against" both high-speed packet and Amateur tcpip. Nothing could be further from the truth. I am, however, intolerant of ignorant, negative, self-defeating behavior in connection with this hobby. It has no place within Ham Radio, and we should all do what we can to minimize the problem by refusing to tolerate that kind of behavior.

I looked at this site. He makes mention of antenna improvements to extend range of existing wireless LAN commercial equipment from a few hundred meters to 25km(and more, using amateur-built amplifiers) - I'd like to see documentation and details of an actual working system that would support these claims.

Apparently the semi-literate "horseshoestew" advocates ignorance and negativity within the hobby. - Or possibly he cannot read any better than he can write, and simply was unable to comprehend my post well enough to respond intelligently.

I guess to expect even average intelligence and a basic level of literacy are a bit too much to expect out of a LandLine Lid. No wonder the concept of Hams using Radio is so difficult for these poor souls to comprehend!

> not appropriate within the context of Amateur Radio.

I don't know anything about that, but I would assume from your tone that
you are blowing things out of proportion. I suppose one way to avoid
problems would be to start all web accesses thru "approved"
amateur-friendly, tecnically-oriented home pages(hello ARRL, hello TAPR)
whose links are regularly verified to ensure that they don't lead to any
indecent, profane, or business-oriented sites(telnet and ftp should also
be allowed with sites on a "approved" list), or sites that in turn
have links that lead to indecent, profane, or business-oriented sites.
If the ARRL(or other amateur groups or individuals) would set up
regulated discussion groups along the lines of rec.amateur.radio.*, or
technically-oriented home pages, why shouldn't we want or be able to
access this material? Of course we couldn't have anyone like you
regulating the discussion groups, because you wouldn't allow any other

opinions, other than your own. By the way, under these restrictions, nocode.org would be an "approved" home page. So would my home page, if I removed all banner advertising, and links to other non-approvable sites:

http://www.geocities.com/SiliconValley/Monitor/2254/

Note that this page is not directly related to ham radio, but would meet the "amateur-friendly" test because it is technically oriented, has no indecency, or profanity, and if I removed all banner advertising it would not contain any business-oriented material, and if I removed most of the links - it would meet the link-test too.

Maybe people would start to look at "amateur-friendly" sites, as "family-friendly", and we amateurs could actually step back up to be viewed as technically-savvy, helpful, and decent people, who are always there to help in an emergency. I can see it now, an earthquake, flood, or hurricane devastates an area's communications - but folks can get information on their loved ones instantly OVER THE INTERNET from hams in the disaster area with HF or VHF packet trunks. Are you listening, ARRL? If you could just stop bickering about silly old Morse code for 10 minutes, you would realize that you have a GOLDEN opportunity that you are letting pass by.

> international forums such as this one.

Once again, YOU are the one being negative, and who is blocking progress. You lost the "code war", and now you are looking to block progress on the TCP/IP high-speed packet front. You will lose again.

Don't tell me, you were once a NET/ROM node or PBBS operator? You may have even had access to an HF or a 9600bps trunk link. How could I

guess?

> Once a few idiots have been "weeded out", I believe that more decent,

924. Wake up ARRL - it is the year 2000.

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-03 00:00:00 UTC
From: horseshoestew@my-deja.com
Message-ID: <89n54m$h2d$1@nnrp1.deja.com>
Source record: 13999
Cross-posted to: rec.radio.amateur.digital.misc,rec.amateur.radio.policy

There is some debate as to amateur radio access to the Internet. I suppose one way to avoid problems would be to start all web accesses thru "approved" amateur-friendly, technically-oriented home pages(hello ARRL, hello TAPR) whose links are regularly verified to ensure that they don't lead to any indecent, profane, or business-oriented sites(telnet and ftp should also be allowed with sites on a "approved" list), or sites that in turn have links that lead to indecent, profane, or business-oriented sites. If the ARRL(or other amateur groups or individuals) would set up regulated discussion groups along the lines of rec.amateur.radio.*, or technically-oriented home pages, why shouldn't we want or be able to access this material? By the way, under these restrictions, not only would the ARRL home page be approvable, but so would the nocode.org home page. So would my home page, if I removed all banner advertising, and links to other non-approvable sites:

http://www.geocities.com/SiliconValley/Monitor/2254/

Note that this page is not directly related to ham radio, but would meet the "amateur-friendly" test because it is technically oriented, has no indecency, or profanity, and if I removed all banner advertising it would not contain any business-oriented material, and if I removed most of the links - it would meet the link-test too.

Maybe people would start to look at "amateur-friendly" sites, as "family-friendly", and we amateurs could actually step back up to be viewed as technically-savvy, helpful, and decent people, who are always there to help in an emergency. I can see it now, an earthquake, flood, or hurricane devastates an area's communications - but folks can get information or chat with their loved ones instantly OVER THE INTERNET from hams in the disaster area with HF or VHF packet trunks.

Are you listening, ARRL? If you could just stop bickering about silly old Morse code for 10 minutes, you would realize that you have a GOLDEN opportunity that you are letting pass by. Fix up your indexing to allow quick access to the most-used services, add moderated discussion and chat services, and start adding links to technically-oriented family friendly sites. Become the leader in getting amateurs to hook up their computers to the Internet thru radio, by distributing information and providing links to other organizations that provide this information. Publish guidelines for the proper way to access the Internet over amateur frequencies. Add an emergency communication service, and conduct mock emergency message distribution over the Internet. Oh, and allow access to your site with arrl.org, instead of only thru www.arrl.org.

I looking to buy a IC-M710, marine SSB HF radio and want to hoot it up to m computer. Before I accidentally fry anything, I want to make sure the input and out puts are compatible. I'm looking for the microphone impedance, microphone sensitivity, headphone impedance, and headphone output voltage.

926. Digital Amateur Radio License

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-04 00:00:00 UTC
From: skoric@ptt.YU
Message-ID: <01bf85f3$7a4ce4b0$1500b42c@yt7mpb-9>
Source record: 13912

Some suggestions for the new Millenium, but I wouldn't like anybody thinking this is another Morse/No-Morse topic. You'd better don't read it.

While reading QST I've noticed that there is no one packet-radio (or any other ham-digital mode) email address. The ARRL officers, HQ emloyees, directors - no one has put his or her packet or similar address to be contacted. Even I can remember some years ago, a couple of section managers had their packet addresses printed in QST, but they disappeared. Why? For the reason of speed, security on the Internet or something else?

The decrease of ham-digital traffic and the increase of internet email between hams has been recognized. Of course, there are much more computer-related people surrounding us than communication ones. But, is there anything we can do, beside crying over the spilt milk?

I would suggest to allow entering all ham bands to as many computer enthusiasts as possible. How? Let's make a "digital" license. Holders of the "digital" ticket would be permitted to enter ANY ham band, but ONLY 'data' portions of. Just imagine how many kids, students, engineers etc (that spend hours and hours by the keyboards) would like a "digital" ticket. They wouldn't need to learn morse and other things that they won't work. In return, they would have to pass some questions like: hardware, software, operational systems, excellent written english and similar. Why not?

They wouldn't make problems to other hams, because they would have to use dedicated radios, factory made for 'data' activities (no mike, no key, no other than data portions of spectrum). Such radios would be very easy to be manufactured, thanks to microprocessors already implemented. Their prices might be decreased too. I talked to many candidates for "digital" license that think it is vital for amateur radio future.

There is no guarantee that an email message sent via packet is ever received.
Thus, most use the internet, where the message is guaranteed to be delivered,
and if selected will even tell you the time and date your message was read.

> I would suggest to allow entering all ham bands to as many computer
> enthusiasts as possible. How? Let's make a "digital" license.

Redundant. Anyone can now get a license, even I passed the 5 WPM code
test. I say what we have in April, is what we will have for at least 35 more
years. The governments will be modifying the rules based on need for our
frequencies, but other than that, very minor rules changes.

Steve

There is no commercial or military use -- it was developed especially
for amateur use, and I don't think the license for the source code permits
non-amateur use without permission.

I have a Compaq Contura (486-100Mhz) laptop, which does not have a sound card.
I am thinking of adding a PCMCIA sound card (Eiger Labs or equiv) to
get on PSK31. Has anyone out there successfully used a PCMCIA soundcard
with a laptop, especially a 100 Mhz 486 laptop, and been successful at
operating
PSK31?? I 'd like to know if it will work before I buy the sounds card.
Thanks,
John

John, I think that your first consideration should be the amount of RAM
in the computer and the second consideration should be CPU speed. The
more advanced PSK31 programs like DigiPan make heavy demands on both. I
have operated with a 32 meg Pentium 166 MHz laptop but it is a stretch.

There is no guarantee that an email message sent via Internet is ever
received either! The Internet email system operates on exactly the same
principles as the packet radio one: accept a message from a client, then
do your best to deliver it to a system nearer to the recepient. When you
detect a recoverable error, retry. When it seems to be fatal or too
many attempts fail, generate a message back to the sender and attempt
to deliver that error message using the same principles.
Messages can get lost between store and forward, information "in the
routing tables" (MX records on Internet) can be (temporarily) wrong causing
loops, and receivers can lose messages before having read them.

The fact that you may see more messages fail on packet than on the Internet
is solely an indication of a better reliability of the average system on
the Internet than on packet, not of an inherently more reliable protocol
on Internet. The fact that the Internet usually uses less intermediate
hops to store-and-forward your message also contributes.

But there certainly is no "guarantee".

Delivery confirmation is just as optional as it is on packet: there even
are several different protocols, and most mail clients don't implement all
protocols. Some of the earlier protocols (still in wide use) are no better
than the //ACK method used in F6FBB BBS.

Agreed
Jan
This is what I have as info about it from an other group:

Start (you find the discussion in comp.sys.ibm.pc.hardware.chips)
>>
>>It's the SubSeven trojan, you DON'T want to mess with it.
>
>Out of curiosity what does that do?

The SubSeven backdoor was first discovered in May 1999. First samples of
this backdoor
were not packed and were easy to detect.

Later version were packed and could not be easily detected by contemporary
anti-virus
programs that had no Win32 'Aspack' file compressor unpacking capabilities.
The backdoor
was distributed under different names via newsgroups and e-mails.
~~~~~~~~~~~~~~

When run, the backdoor copies itself to \Windows\ directory with the
original name of file
it was run from or as SERVER.EXE, KERNEL16.DL, RUNDLL16.COM,
SYSTEMTRAYICON!.EXE or
WINDOW.EXE. Then it unpacks a single DLL file to \Windows\System\
directory -
WATCHING.DLL. After that the backdoor patches Registry so its main
application could be
run during next Windows bootups (RunServices key) and finally creates and
modifies some
other Registry keys. The backdoor can also install itself to system by
modifying WIN.INI
file.

(this copy creates msrexe.exe, and mueexe.exe in the Windows dir, and
creates a registry
key that won't allow any application to run without musexe.exe being found.)

The SubSeven backdoor task being active in memory (and invisible in Task
Manager) looks
for TCP/IP connections, and if they are established it listens to TCP/IP
ports for
commands from client part. A person who has a client part gets control over
remote system
where the server part is installed. Here's the list of 113 SubSeven's
capablities:

Fun Manager
----
1. Open Web Browser to specified location.
2. Restart Windows.
3. Reverse Mouse buttons.
4. Hide Mouse Pointer.
5. Move Mouse.
6. Mouse Trail Config.

Probably for the same reasons you sent your message via the Internet, rather
than packet: ubiquity and reliability.

Nope, sorry.

Not finding an answer for that question is why I've stayed away from the Baypack type modems. Ran into that problem with many of the packet progs I wanted use back then. Maybe just didn't look in the right places, never found the answer.

HOWEVER, if you can run Win9x (98 is best choice), WinAPRS will work with a Baypack type modem if you use the AGW packet engine.

Good luck!

940. PKGold dos version in win98

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-05 00:00:00 UTC
From: James McLaughlin <dearborn@voyager.net>
Message-ID: <38c3160d$0$19368@news.execpc.com>
Source record: 13926

Any ideas how I can get m PKGold version 9, to run under windows 98 second edition. Interflex responded to me and said that it was a windows driver problem, due to the way Hewlett-Packard loads the software during production. HP says its a windows problem and not a HP problem. Microsoft says to contact the software manufacture...hello circle shuffle time.

The HP simply cannot recognize comp port #1 for instance, both com ports have been checked, are turned on and active, and the speed has been matched to that of the PK-232MBX. If I shutdown and restart (but NOT from a dos propmpt in windows)in dos, then the software plays just fine.

Any thoughts would be appreciated.

Yes.

Download the SV2AGW software. Run that, and then set up WinAPRS
to use AGW. You can also use UI-View (another APRS program).

Don't have Windows?

Tough luck, get a TNC.

Steve

I use KA-Gold ver 9 here, also under Win98. It works without a hitch. I do, however, have my COM port activated in BIOS, rather than let Windows handle it "automatically".

That might be the ticket for you.

I sure would like to see a true Windows version of Ka/Pk Gold, but until then, I still enjoy my last DOS application. Interflex does seem to have lost interest in further development of the software; a pity because I like it better than anything else that has yet come along.

Used Lan-link for years, It will not run on Pent 11 ect.
Wtb any pgm to replace it. Can't afford New Kagold etc.
A dos vers would be fine, tho can use Win 95 etc.

TIA,
Albert, Wa3fib

Source record: 13940

I'd like to try building a multi-pc net via sound-cards, speakers, and microphones alone. I'm aware that the bit rate will have to be slow. Ideally, I'd like to find a bit of software that controls the sound-card, but I'd like to build some pretty strange protocols on top of this for myself.
Can someone give me a push in the right direction? Are there low level routines around that implement this?

955. Re: Formula to determine throughput

Just speculation on my part, but I suspect that using ham radio (packet
e-mail)
for ARRL-related communications (other than bulletins of general interest)
could
be construed as "furthering the business of the ARRL." That may be why ARRL
officials don't have packet e-mail addresses published.

Now, I would be in favor of loosening restrictions on content on packet to
the degree which would permit the ampr.org domain to become a more
useful part of the internet, both for amateur purposes and for the ability
to
interconnect to the internet more easily for the purposes of emergency and
disaster communications.

The UK is allowing amateur interconnects to the internet (albeit on a
somewhat
limited, experimental basis to start). There is an article on this on the
NCI
website http://www.nocode.org in the articles page
(http://www.nocode.org/articles.html
for those with Java applet-impaired browsers).

Is there currently a legal issue with ampr.org+internet, as far as emergency
and disaster communications are concerned? I assumed that setting up,
'emergency internet' or something like this would be completely legit'
according to current rules.

Personally, I don't think it would be the end of the world, if we
could send correspondence to a ham radio magazine via ham radio --
really.

Despite Rob's tongue-in-cheek response, there IS a solution to your request!

PSK31 runs quite well over audio links as you describe. Data rate is 31.25 baud with no error correction. While that sounds slow, it exceeds the capabilities of the average ham typist and is comparable to about 40+ wpm of CW, so it is adequately fast for conversation, but probably lacking considerably for file transfers.

It is becoming widely used on HF for keyboard-keyboard informal QSOs. Last evening, for example, I had a QSO with VK4GP at about 0530Z with about 90% clear print. We were each running about 50 watts output power to modest antennas.

PSK31 over straight audio paths has become the preferred setup for demonstrating the mode at ham club meetings and the like. Two laptops are set up within "hearing" of each other, etc.

PSK31 software is available free from several sources. The program I use and prefer is called DigiPan. It is available at

http://members.home.com/hteller/digipan/

PSK31 is probably the most rapidly growing digital mode on HF today. Its obvious advantage is the fact that no additional hardware is needed and the software is free! It is no competition for Pactor, et al, where accuracy is paramount but as a near-free replacement for RTTY it is making great strides in displacing that mode.

I remember doing a search for "Linux" and "AX.25" and turning up a few sites
that had it. I think it's called "CLX".

961. POCSAG (PD2.05) Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-07 00:00:00 UTC
From: PhilPerkins <phil@pervisell.com>
Message-ID: <38C565EB.2030B8BF@pervisell.com>
Source record: 13852

The latest version of the popular Pocsag (pagers) monitoring program,
written by Peter Baston , has just been released.

VERSION 2.05 February 2000

* Added support for parallel printer output.
* TEXTSCAN.INI can now have up to 100 strings.
* Logging of TEXTSCAN pages to separate log files.
* TEXTSCAN strings now work with space at beginning or end.
* Select logging of numeric, alpha or both via "logging" variable.
* Time stamping of received pages on screen.
* Fixed "Year 2000" bug in "expire" feature.
* Switching between two mapping tables, using control codes
(see CHINESE.LNG).

Existing registered user's key files will work OK with it - just copy
your key file into the working directory OR just overwrite your
existing version with the very latest.

Feel free to download it and try it - the main limitations in the
shareware
program are a 15 minute timeout (just run the program again) and no
logging to disk.

Free download from http://www.pervisell.com

clx is one, clusse is another. There are links to both at
http://radio.linux.org.au (in the packet area).

Really. What MAC address do they use for 28.8k HDLC?

Most users will notice about 2.8k to 3k throughput on their
Netscape and IE meters for this speed.

Yes, it's impossible to state actual throughput, only theoretical,
or experienced rates, which have nothing to do with where you
may live. For example, I live 10 miles from switching center, and
my analog lines suck. ISDN works fine, because they make it fine
as part of my monthly bill :-)

Quadruple this speed for a half-duplex link over radio.

964. Question about telescoping TV mast

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-07 00:00:00 UTC
From: horseshoestew@my-deja.com
Message-ID: <8a449pfqh1@nnrp1.deja.com>
Source record: 13855
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc

My Dad has a telescoping TV mast at his home(I'd guess it was 40-50' high). The rotor has gone bad, and I'd like to replace it. Furthermore, I wouldn't mind putting a 2m/440 dual-band antenna on top of it while I have it down.

The thing is - how the heck do you collapse these things? There are bolts that extend from each outer sleeve into the next inner sleeve. I can see if I loosen the bolts the next successive inner sleeve will fall down into the outer sleeve - but what stops it from falling really fast! Should I just loosen them slowly and hope I reach a good friction point so the thing falls slowly? Is there a better technique?

Thanks,
Stewart - N0MHS

Rob ... two points ... first, only selected traffic would be routed to an
amateur "patch" link, second, I believe that IF we were allowed to
connect to and pass traffic to/from the internet much higher bandwidth
links would become more common, since they would be more useful
with more content to access.

Basically brute force ... you use a heavy set of work gloves and go with
care.

> Should I just loosen them slowly and hope I reach a good
> friction point so the thing falls slowly?

If you do that, the bolts will scrape off the galvanizing in a strip the
whole
length of the mast sections, resulting in rust and eventual structural
weakening.

> Is there a better technique?

Not that I know of ... you can always have two sets of heavily-gloved
hands to provide the friction brake. Unless the thing is overloaded at the
top,
it should be manageable.

It would also be helpful if you had enough hands to manage the guy wires
so that the thing stays more or less straight as you bring it down a section
at a time from the top of the bottom section. That will help to prevent
collapse
of the upper sections by keeping them from flexing to the sides as you lower
the sections ... without some *gentle* guy force to keep things vertical as
it
comes down, the top sections could flex to the side and buckle and collapse.

Good luck, and most of all have enough help to do it safely and be careful.
(ALSO ... make DAMNED sure that there is NO way the thing could come
into contact with any power lines if it should decide to buckle and collapse

in ANY direction!!!!)

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc

What Carl said. Lower each section slowly. Use good, thick gloves and keep your fingers out of trouble's way. Don't Drop It!

I've had some luck using pipe clamps big enough to go around the mast as stops, preventing a runaway fall. However, you'll want these to apply an even force around the mast as otherwise they can deform it, prevent it from telescoping and make it more vulnerable to buckling.

Too much weight on top of the mast makes it dangerous to collapse and very hard to raise. But if you have that kind of weight up there, you need a tower, not a telescoping mast.

I want to thank all who pointed me to various web sites.

I also had one e-mail response that pointed me to:
http://www.cestro.com/pcluster/
which has several links to cluster software enhancements
as well a Perl cluster software system.

970. Formula to determine throughput

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-07 00:00:00 UTC
From: Mooneer Salem <mooneer@earthlink.net>
Message-ID: <7HXw4.7802$kD4.325382@newsread2.prod.itd.earthlink.net>
Source record: 13945

Are there any specific formulas to determine how much K/sec I would get over an x kilobyte per second link? (based on perfect conditions.) I want to determine what kind of equipment and the TNC needed to handle Internet traffic through a 28.8 modem. Isn't there a formula for modem connections like this (convert to bytes per second and divide by 8)?

-Mooneer (callsign pending)

Steve Sampson <ssampson@usa-site.net> wrote:
>1 Start Bit, 1 Stop Bit, and 8 data bits, or 10 bits total.

>28.8 kbps / 10 bits = 2.88 k Bytes per second (full duplex).

Wrong. Both 28k8 modems and packet radio don't use the ASYNC format,
they use HDLC. So 8 bits per byte plus a few percent overhead for
bitstuffing and flags.

Besides that, it doesn't answer the question he asked.
(which is not so simple to answer because it depends on many more variables)

Do you really think radio amateurs would be able to setup an "emergency
Internet" that would be capable of providing even the very least usable
service in the case of a diaster???

The traffic on any Internet "backbone" link is several orders of magnitude
above the links that radio amateurs have constructed.
You won't stand a chance when Internet traffic is routed via your link.
Packet loss will be 99.999%.

I don't think they are contemplating a backup for the "backbone", Rob. (At
least, not the coherent ones.)

The impression I get is that they are talking about a reasonably fast
(56kb?) portable link to the "backbone" for a single user or entity, in
times when local access is down, or pre-empted by the Federal Emergency
Management Administration. (FEMA)

In times of emergency, assuming the phones are still working at all, then
they are immediately taken over by FEMA to keep them from getting tied up by
thousands of individuals trying to find out if relatives in the disaster
area are OK, and so on.

FEMA then parcels out access on the basis of need and utility.

Publishers of True Knowledge in Astrology and Astropsychology
NEWS Press Release

Attention all Promoters, Radio and Television Hosts Reps!
If you are an individual with a radio or television program and would like to assure your audience an incredible time, please contact us at your earliest convenience.

Dear Sir or Madam,

I would like to call to your attention to a fascinating author, Dr. Louis Turi. Like his eminent predecessor, Nostradamus, he was born and raised in Provence, France. He is a noted an unusual astrologer of unparalleled track of unarguable predictions in our modern time.

Dr. Turi is a very unusual astrologer and, like Nostradamus, used to do he also uses the location of the Dragon's Head and Tail in his forecast. The response from Dr. Turi's teachings and books are just phenomenal. I am sure you will be, as much as your audience fascinated by his metaphysical knowledge. Please do not hesitate to contact me at the above-mentioned address and telephone number for any questions you may have.

Dr. Turi is regularly on national radio and his infomercial will be aired nationwide and Canada early 2000. If you are interested in booking Dr. Turi on your show I will be glad to send you more on his biography and copy of his books. Dr. Turi is the only Astrophile in the world that has been granted financial support from much Board of Directors to produce astrological videos and forecast on respective California and Nevada cities.

He also performs Astropsychology readings for people as well as predictions on the daily occurrence for the world. He is able to depict what each and every individual in this world is going through by just asking, "What month were you born?" He is also able to clarify to anyone everything that they've been through, buy knowing their date of birth. Not only is Dr. Turi an Astrophile that predict occurrences but also is also extremely practical and has quite a gift that needs to be shared to the whole world. Once you have discovered his talent you can be sure that your life will change in the most positive light. His simple personality and his incredible gift will amaze your audience. For more details you may call me and I will have Dr. Turi talk directly to you for a sample of what will be discussed on your show.

Please let me know if you would like to schedule an appearance on your show and I thank you again for your consideration.

Waiting in anticipation.

Sincerely, ~ Promotional Manager ~ Startheme Publications

I don't think so. Yes, you would probably see a lot of "fast local access"
systems, where a group of local amateurs are using it as a free access to
Internet. Most likely they will attach an outdoor antenna to a wireless
LAN adapter.
But I fail to see why there would suddenly appear many high bandwidth links
in these circumstances, links that would be useful as backup links for the
Internet. More likely, even more radio links will be dismantled
"because you can route via Internet", just like it happened with the
BBS forwarding.

V.42 is HDLC.

>Most users will notice about 2.8k to 3k throughput on their
>Netscape and IE meters for this speed.

But when they would use Zmodem, they would see 3.5k.
TCP/IP and packet loss on the Internet probably makes up for the
difference.

>Yes, it's impossible to state actual throughput, only theoretical,
>or experienced rates, which have nothing to do with where you
>may live. For example, I live 10 miles from switching center, and
>my analog lines suck. ISDN works fine, because they make it fine
>as part of my monthly bill :-)

Of course I have ISDN, it is not much more expensive than analog over here,
and less expensive than two analog lines. But that is another topic.

I wondered what the motivation would be... I knew it most certainly wasn't
concern for your fellow man, a desire to be useful in emergencies, or
anything like that.
...So you want to bypass the decency restrictions so you can rationalize
using an ultra-high speed link that you'll probably never build. Boy o Boy.

You may be a cheap whore Carl, but I can assure you that Amateur Radio
isn't. Knock yourself out trying to have the decency rules set aside, OM.

You may be a cheap whore Carl, but I can assure you that Amateur Radio
isn't. Knock yourself out trying to have the decency rules set aside, OM.

I can assure you that if your fellow LandLine Lids had any desire to use
Radio they would have long ago. There are a number of viable high-speed

systems that have been generally available for years. By and large, these are seeing very little use here in the US.

The MOST IMPORTANT point is to get all the suggestions FIRST.

When you're ready to go, thank them for their suggestions, tell
them how it's going to be done because it's YOUR mast and YOUR
responsibility and YOU are in charge.

I hear what you are saying - you don't want to be arguing in the middle
of taking the darn thing down.

The problem is - it is actually my Dad's mast. And he loves to
criticize. But I will take your advice and consult him to the hilt,
before I start - pointing out that once I start - it is my project, and
I'm in charge.

Before you buy.

985. TS-440 and pactor receive errors

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-08 00:00:00 UTC
From: 106255.1565@compuserve.com
Message-ID: <38c6d40f.15871295@news.compuserve.com>
Source record: 13871

I have a TS-440 connected to a PK-232DSP using a fully isolated
interface (transformers and opto isolators) via the 13 pin accessory
connector. There is no sign of RF bleedthrough.
I am getting high error rates on receive with a good signal when using
either the 500Hz or 1.8kHz if filters even though the tones are spot
on using an audio spectrum display, and centred on the filter
passband.
Could AGC reaction time be the problem, if so is there any component I
should change?
Thanks
Richard

986. Kantronics 9612P 1200 or 9600 baud add-on board close out info.

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-08 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <ZGBx4.7552$yV1.1855572@tw11.nn.bcandid.com>
Source record: 13872

Cheryl at Kantronics wanted me to pass this latest closeout to the group.

The 9612p add on board adds a 3rd port to your dual port 9612P. This will allow you to have either a extra 1200 or 9600 baud port on your 9612P.

Kantronics is closing them out at the following prices:

1200 baud - $59.00
9600 baud - $79.00

This includes the add on board, new panels and case top. Another great close out deal for the Kantronics users. There is a limited quanity, so it's first come, first serve.

The GPS Trackers were gone in two hours, so best to get your order in early.

Kantronics can be contacted at:

sales@kantronics.com or 785-842-7745

Are you in broadcast mode, or are you in ARQ mode??

If in ARQ, you may have a timing problem between xcvr de-key and
it's ability to hear the traffic from the other station

Make Easy Money! Earn Over $10000 in weeks!

Just follow these simple instructions!

LOTS OF CASH, FAST - THIS IS A MAILING LIST PROGRAM -AND COMPLETELY =
LEGAL, THIS REALLY WORKS!! THIS REALLY CAN MAKE YOU EASY MONEY!!IT =
WORKS!!BUT YOU HAVE TO FOLLOW THIS LETTER FOR IT TO WORK!!!! A little =
while back, I was browsing through news groups, just like you are =
now,and came across an article similar to this that said you could make =
thousands of dollars within weeks with only an initial investment of =
6.00!So I thought,"Yeah ,right,this must be a scam", but like most of =
us, I was curious, so I kept reading. Anyway,it said that you send =
$1.00to each of the 6 names and address stated in the article. You then =
place your own name and address in the bottom of the list at #6, and =
post the article in at least 200 news groups.(There are thousands) No =
catch,that was it.So after thinking it over, and talking to a few people =
first,I thought about trying it. I figured what have I got to loose =
except 6 stamps and $6.00, right?Like most of us I was a little =
skeptical and worried about the legal aspects of it all.So I checked it =
out with the U.S. Post Office (1-800-725-2161) and they confirmed it was =
indeed legal! Then I invested the measly $6.00. Well GUESS =
WHAT!!...within 7 days,I started getting money in the mail ! I was =
shocked! I figured it would end soon,but the money just kept coming in. =
In my first, week I made about $25.00. By the end of the second week I =
had made a total of over $1,000.00! In the third week I had over =
$10,000.00 and it's still growing.This is now my fourth week and I have =
made a total of just over $42,000.00 and it is still coming in =
rapidly.It's certainly worth $6.00 and 6 stamps.Let me tell you how this =
works and most importantly, why it works...also make sure you print a =
copy of this article NOW,so you can get information off of it as you =
need it. Believe me, it does work!!
STEP 1:=20
Get 6 separate pieces of paper and write the following on each piece of =
paper"PLEASE PUT ME ON YOUR MAILING LIST".Now get 6 US $1.00 bills and =
place ONE inside each pieces of paper so the bill will not be seen =
through the envelope to prevent thievery. Next, place one paper in each =
of the 6 envelopes and seal them.Now,you should have 6 sealed =
envelopes,each with a piece of paper stating the above phrase,your name =
and address,and a $1.00 bill. What you are doing is creating a service =
```

by this. THIS IS ABSOLUTELY LEGAL! Mail the 6 envelopes to the following =
addresses:=20

#1) S.Bassett RR#1 Cannington,
Ontario,
Canada LOE 1EO=20

#2) Sharon=20
32 Sleepy Hollow LN,
Sicklerville,
NJ 08081=20

#3) Justin=20
3707 Crenna Ave.Concord,
CA 94519=20

#4) Chicollla=20
2 Oxford Mews,=20
Poquoson=20
VA 23662

#5)E. S.K. Law=20
30 Morewood Crescent,=20
Toronto, Ontario,=20
Canada M2K 1L7.

#6) Johny=20

2465 Middle RD

Columbia Falls MT, 59912

(Be sure to use the correct postage when mailing to the the states or =
out of the states)

STEP 2 :=20
Now take the #1 name off the list that you see above, move the other =
names up (6 becomes 5, 5 becomes 4, 4 becomes 3, etc.) add YOUR name as =
number 6 on the list.

STEP 3 :=20
Change anything you need to, but try to keep this article as close to =
original as possible.Now, post your amended article to at least 200 news =
groups. (I think there are close to 24,000 groups.) All you need is 200, =
but remember , the more you post the more money you =
make!---DIRECTIONS---HOW TO POST TO NEWS
GROUPS---=20
STEP 1) You don't need to re-type this entire letter to do your own =
posting. Simply put your cursor at the beginning of this letter and drag =
your cursor to the bottom of this document,and select 'copy' from the =
edit menu. This will copy the entire letter into the computers memory.=20
STEP 2) Open a blank "notepad" file under accessories in windows and =
place your cursor at the top of the blank page.From the 'edit' menu =
select 'paste'.This will paste a copy of the letter into notepad so that =

you can add your name to the list.
STEP 3) Save your new notepad file as a .txt file.If you want to do your =
in different sittings, you will always have this file to go back to.=20
STEP 4)Use Netscape or Internet explorer and try searching for various =
newsgroups (on-line forums, message boards, chat sites, discussions.)
STEP 5) Visit message boards and post this article as a new message by =
highlighting the text of this letter and selecting paste from the edit =
menu. Fill in the Subject,this will be the header everyone sees as then =
scroll through the list of postings in a particular group!**REMEMBER,THE =
MORE NEWSGROUPS YOU POST IN,THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE =
TO POST A MINIMUM OF 200**=20

That's it ! You will begin receiving money from around the world within =
days. You may eventually want to rent a P.O. Box due to the large amount =
of mail you will receive.If you wish to stay anonymous,you can invent a =
name to use, as long as the postman will deliver it. **JUST MAKE SURE =
ALL THE ADDRESSES ARE CORRECT.** Now the WHY part: Out of the 200 =
postings say I only receive 5 replies (a very low example). So then I =
made $5.00 with my name at #6 Now,each of the 5 persons who just sent me =
$1.00 make the MINIMUM 200 postings,each with my name at #5 and only 5 =
persons to each of the original 5, that is another $25.00 for me,now =
those 25 each make 200 MINIMUM posts with my name at #4 and only 5 =
replies each,I will bring in an additional $125.00! Now, those125 =
persons turn around and post the MINIMUM 200 with my name as #3 and I =
only receive 5 replies each,I will make an additional $625.00! OK,now =
here is the fun part,each one of those 625 persons post a MINIMUM of 200 =
letters with my name at #2 and they only receive 5 replies,that just =
made me $3,125.00!!! Those 3,125 persons will deliver this message to =
200 news groups with my name at #1 and if still 5 persons per 200 news =
groups react I will receive $15,625.00! With the original investment of =
only $6.00! AMAZING! When your name is no longer on the list, you just =
take the latest posting in the news groups and send out another $6.00 to =
names on the list, putting your name at number 6 again. And start =
posting again.The thing to remember is, do you realize that thousands of =
people all over the world are joining the internet and reading these =
articles, everday,JUST LIKE YOU ARE NOW!! So can you afford $6.00 and =
see if it really works?? I think so ... People have said,"What if the =
plan is played out and no one sends you the money? So what! What are the =
chances of that happening when there are tons of new honest users and =
new honest users who are joining the internet and newsgroups every day =
and are willing to give it a try? Estimates are at 20,000 to 50,000 new =
users,every day ,with thousands of those joining the actual internet. =
Remember,play FAIRLY and HONESTLY and this will work.=20

------=_NextPart_000_0005_01BF8933.91D29E20

Hi Mike,

I ordered one of those PSK31 kits last year & had no problems. I received it in the mail within 7-10 days of ordering it. So, you definitely haved a problem. The company was legitimate last year. Unfortunately, I can't tell you anything more on the company. Good luck.

Jim, I have PKGold and KAGold and have supported Interflex since the beginning. But they fail to admit that their software is not with the times. They ALWAYS blame something else, a driver, your computer, your TNC, or anything other than the fact, their software will not perform under window properly all the time every time. I just upgraded to Win98 and my PKgold went dead. Won't see any com ports no matter what I do. Their answer is to pay more money and get a "better behaved and newer version" of Gold. Guess what? Not anymore. I have since started using XPwin. Give it a try and your will be convinced. There are others out there too and many like XPware is supported by the author. The boys at Interflex are draging a dead horse and getting you to buy it.

Good luck, Larry W6LAR

Here's a heads up on a "digital voice over HF" article in the next QEX.
Unfortunately, US rules do not (yet) permit the modulation scheme.

I've seen such provisions cited more than once as an excuse for
not adopting new modes - indeed, not even trying them. Why not
lobby the ARRL and/or FCC to open things up a bit to a hobby
that is supposed to be one of experimentation?

When I listen to the garbage that is on HF and apparently
tolerated by the Powers That Be I find it hard to believe that
the Committee on State Security are really going to bash your
door down and haul you and your radio away for making some
unusual noises...

Based on my personal experience as a regional coordinator, I believe this
criticism of Brian is beyond unfounded. Further, why did you see fit to
expand the newsgroups line to include .policy and .misc ?

Actually, I wasn't being critical. I was just raising a question.

I expanded newsgroups, because I think it relates to policy, and ham radio in general. If we can't hook amateur radio into the Internet, we might as well fold up the tent. If we CAN hook amateur radio into the Internet, we are in for another GOLDEN AGE OF HAM RADIO.

You were doing good until you said "if we could reach critical mass."
A critical mass in Ham radio is two people. Any more than that and we
call that a "conflict of personalities."

Sorry, Ham radio is a hobby. It will never serve a purpose. It has never
served a purpose other than hobby fun, and that's what it is all about,
nothing more, nothing less. Those that want to duplicate the internet in
RF are doomed to failure. Those that use the internet as a local tool will
achieve some success.

> we would have to limit ourselves to non-commercial websites, e-mail,
> and file transfers, and services like APRS - but there COULD be PLENTY
> to keep a ham amused, and his peers amazed, and lure more young,
> digitally competent people into the ham ranks.

"we" would have to put up nodes every 30 miles, and spend money. I've
never met a ham that spent money except for DX chasers. But even they
spend all their money on HF amplifiers and monster beams. They still use
morse code and SSB. Pretty low tech operations, with high-tech amplifiers
and antennas.

> Why the heck the ARRL and TAPR are not putting an effort into
> supporting something like this, by gearing there web pages to mobile
> RF access, is beyond me. We are missing a GOLDEN opportunity.

Ever notice the age group the ARRL directors? TAPR is a youthful
group, but there isn't enough membership to mount any new technology
within a couple of years. Their spread spectrum project is interesting,
but may bankrupt them before it is all over. It's been in development
for years, and they finally had to go commercial to save it.

> I suppose most everyone with any knowledge of digital communications
> isn't wasting their time with a non-profit amateur service(even APRS is
> a mess). These kids can be making a bundle in the technical industry
> these days.

You're just a real basket case today. Everyone seems to be having a
problem except you?

> It is too bad that most of the retired old hams are too old
> to learn new tricks - they could be a valuable resourse to help make this
> happen - but many of them seem to be content drooling on their CW
> sending keys, and crying about "bitter dregs".

That last paragraph is the "conflict of personalities" I was talking about above. You would rather toss rocks, than join hands. It's a shame, but that's how the hobby is seen by others.

A notebook with a radio modem? You must be referring to Ricochet/Metricom.

What do you think a critical mass actually is?

Shit, I can tell already that you are one of those hams who camp out on
one frequency and bemoan everything introduced since 1954...

I bet you don't even know what the contents of 99.99% of the rest of
Ham radio has to offer.

We don't have to worry about space. You guys are all dropping dead
like fly's, and it's a great year to see all the one frequency hams get their
ARRL SK awards.

Hello, just got an Alinco DJ-190T in the mail today. I've been playing
with it for a couple hours and feel that this is a great transceiver for
use with packet radio.

Has anyone gotten an Alinco DJ-190T to work with a soundmodem setup?
If so, how was it done? Would it be possible to use any 9600 TNC or
soundmodem setup with this transceiver (since the mic input connecter seems
to have
its own VOX circuitry to automatically turn on the PTT circuit)?

>Unfortunately, US rules do not (yet) permit the modulation scheme.

We are allowed to use voice modulation types A, J, and D on HF. So
anywhere voice modulation is permitted, we can use a digital voice
modulation (provided the emission meets the occupied bandwidth
limit for type A voice emission on HF, ie 6 kHz).

Unlike data emissions, digital voice isn't constrained as to baud on HF
(other than as to how baud affects occupied bandwidth, of course). Nor
are we limited to use of specified code alphabets (doesn't apply).

The scheme being presented actually fits in an ordinary 2700 Hz SSB
channel width (36 tones, each modulated 50 baud BPSK and spaced
62.5 Hz). So it should be perfectly legal for use in the voice band segments
of HF under current Part 97 regulations.

But the question is not how much spectrum it occupies. The question is how much throughput and voice recovery quality is accomplished in that spectrum. Guess we'll see next month. It does mention "1800-baud, multi-carrier" format. And after all, it's just a first step. The land speed record didn't break the sound-barrier on the first try.

Digital voice promises no apparent QRM, QRN, or QSB. That characteristic should be worth a little spectrum. Of course, some opposed to change of any kind will say it's not ham radio without QRM, QRN, and QSB.

QEX is so worthwhile to technically-minded radio experimenters, it is
your loss not to get it, especially now that it is combined with CommQuart.

Steve Sampson previously posted this reference to the DVHF project:
http://www.chbrain.dircon.co.uk/dvhf.html

If this is the same project, it appears that the modem is designed to
fit into a standard SSB-width channel. Why did you assume otherwise?

From March/April 2000 QEX: "In our 200th issue, learn about a mode that may catch on: digital voice over HF. Charles Brain, G4GUO, and Andy Talbot, G4JNT, explain how to do it and what to expect. Beware, though: US rules do not currently permit their 1800-baud, multi-carrier modulation format below 30MHz. Request for Special Temporary Authorities (STAs) should be coordinated through the ARRL to avoid duplication of effort. Contact ARRL Counsel Chris Imlay, W3KD (w3kd@arrl.org) if you are interested in obtaining an STA for this mode."

I'm CC:ing this to W3KD. Perhaps he can shed some light.

You know Brian, you could at least follow the link and actually READ the article.

The vocoder requires 2400 bps, and 1200 bps extra FEC is done over the top of that. The modem employs 36 tones spaced at 50 hz, using OFDM (orthogonal frequency data multiplexing). If you multiply that out, you get 1800 hz.

I've hardly been following the state of the art in speech vocoding, but the resulting decoded audio sounds remarkable given the low data rate of the incoming speech, much better than the old LPC based stuff I'm used to hearing. There were some glitches vaguely reminiscent of my PCS cell phone when operating near it's limits, but overall the quality was pretty good. Obviously on HF the noise environment is rather severe, so it remains to be seen how truly practical this works out to be, but it is interesting work.

Correction of my part. The freqs are spaced at 62.5. This makes the bandwidth slightly larger, but still within the 2700 hz normally allocated for voice channels.

Ham radio is essentially irrelevent to modern emergency and disaster
communications, as you very well know. We hams have little or nothing
to offer anymore; our services have been eclipsed by modern technology
in the hands of professionals.

ampr.org and the amprnet are primarily for research, development, and
recreation. It should not be depended upon for production or safety use.

Hey, Brian - are you still the amateur radio IP address coordinator?

You have a point when you say Ham radio is essentially irrelevent to modern emergency and disaster communications - but yet it does have SOME relevance that shouldn't be totally ruled out. And the fact that we COULD hook into the Internet, could bring amateur emergency communications into the 21st century - as YOU very well know.

Last time I remember(back in '95, I think it was) you were being very stingy with handing out IP addresses to amateurs. I had to really fight to get a set of 8-bit subnet addresses. It sounded like you were working to refarm the addresses for commercial purposes. That kind of sounds like a conflict of interest to me. This isn't why you are so against the expansion of amateur use of the Internet - is it?

Maybe I'm being too critical of you. You may have been the one to get us IP addresses in the first place? Let the genie out the bottle, eh? Anyway, I think you 'ought to be a little bit more open to expanding amateur use of the Internet. It really is the future, you know. If we can't expand in the area of digial

Come on now. A laptop going thru a 9.6kbps or 56kbps amateur network
would be MUCH better and cheaper than these "services"(if we could
reach critical mass - which wouldn't be that hard at all). Of course
we would have to limit ourselves to non-commercial websites, e-mail,
and file transfers, and services like APRS - but there COULD be PLENTY
to keep a ham amused, and his peers amazed, and lure more young,
digitally competent people into the ham ranks. Why the heck the ARRL
and TAPR are not putting an effort into supporting something like this,
by gearing there web pages to mobile RF access, is beyond me. We are

missing a GOLDEN opportunity. I suppose most everyone with any knowledge of digital communications isn't wasting their time with a non-profit amateur service(even APRS is a mess). These kids can be making a bundle in the technical industry these days. It is too bad that most of the retired old hams are too old to learn new tricks - they could be a valuable resourse to help make this happen - but many of them seem to be content drooling on their CW sending keys, and crying about "bitter dregs".

First season. This episode also contained TV's first interacial
kiss(Kirk-Uhura).

Sure it has something to do with HF. He is warning older guys that
young lads in their "velvet prime" will come and drink all the best
from their "finest kegs" and leave them with "bitter dregs"(HF).

Your correct Roger, however we must remember that the average
ham is so far disconnected from normal mainstream society, that
something as inane as linking this diddy from S.T. to HF is humorous
to him. Case in point, now that it's getting warm outside start looking
around you at some of the people at the next hamfest you attend.
You'll never see such an oddball bunch at any other place, even train
and railroad shows. I'll never forget one guy I saw last year at Dayton.
Guy was wearin striped short pants, argyle socks and penny loafer
shoes. This was topped off with a golf shirt that looked as if it lhad last
saw the inside of a washing machine in 1992. Did I mention his Pith-hat
with the rubber duckie antenna *glued* on the side? What a bunch of
freaks, geeks and commensurate goofballs!

Aw c'mon, Cecil, sure it does. Consider what 20m phone would sound
like today if either AM or NBFM were the dominant HF phone modes
instead of ssb which is roughly half the bandwidth of AM/NBFM.
Conservation of spectrum space wrt to getting the job done is very
much a legitimate concern and mode advantage.
>

That brings "philosophical" issues into the game. Or call it
preferences or priorities or expectations or whatever. For my own part
I couldn't care less about "hi-fi" ham phone qsos, what I do care
about is being able to squeeze the incoming intelligence out of the
other guy's voice transmission particularly under weak signal and/or
difficult qrm/qsb/qrn condx. If I want whizzy audio I do my Bonnie
Raitt CDs with the Yamaha and Polks, not with dx on 75 or 20 phone and
I ain't out here by myself. Other folks views and objectives are in
line with S9+20 hi-fi armchair copy and would probably just love 2%
THD 20m qsos. To each their own, we all have tickets to ride.

If you're talking significant legislated setasides on the primary HF bands for the convenience of a few digital experimenters to do their thing I'll go to the wall to the extent possible to defeat any such proposal as lame as such efforts might be. Stuff anything even resembling spread rectum, ham cell phone "channels" and "Internet portals" on HF, take those to 925MHz where the bandwith is available to do those without screwing up the HF bands for the rest of us.
>
If you're talking a slice here and there perhaps on the high ends of, let's say, 17 or 15m where reasonable bandwith HF digital phone experimentation could and I think should be legalized under controlled condx without materially impacting current ops yeah, I could support that.
>
>Of course, some
>opposed to change of any kind will say it's not ham radio without
>QRM, QRN, and QSB.
>--
Obviously. We're clearly overrun with Luddites. The problem being of course that if you kill the Luddites ya doan have much left. Not my problem because I ain't one of those, you're preaching to the choir if I'm copying you correctly Cecil.
>
Dunno how many times self and some others have harped on the fact that NO new HF modes digital or otherwise will fly in volume unless the market sees a clear justification based on communications effectiveness in all or at least most of it's translations in fair and square competition for said market like ssb basically did when it beat out AM and NBFM. In other words just because it's "digital" don't expect any "special deals" from the market. Including spectrum space and bandwidth "deals". Get it on the air under the same rules the rest of the competitors follow and let the cards fall where they will.
>
And don't even think about anybody giving up space just so that the few who are into hi-fi digital 20m phone can glom excessive bandwidth for their own amusement.
>
>73, Cecil, W6RCA http://www.mindspring.com/~w6rca

Well let's explore that a bit. I'm up and running on all nine HF bands
with ssb and cw including all the Extra setasides plus 2m FM plus I've
done plenty of 2m packet plus I've glomed "thingeys" like 300 or so
dxcc countries confirmed phone/cw plus WAZ plus a CP35 certificate
plus a very early 5BDXCC and and ummm . . actually who could possibly
give a rat's ass what you "think". As if.

(cut)

I cannot believe I'm reading this. Virtually every time there is a major
hurricane in
North Carolina (once/twice per year), every other mode of communcations is
down.
During Fran, we even had Gov. Hunt checking the damage from the EOC in
Raleigh,
and, the National Guard and police used the 2 meter band (on repeaters
linked from
Raleigh to the coast in Wilmington) as well as 3107 and 3121 on 75 meters.
In addition, the National weather service gets real time reports by
communicating
with hams on 2m repeaters using the Skywarn system, which even the TV
forecasters
listen to, and people with scanners listen to, to find out what is really
happening outside.
This is the best WX information available. Most active local hams
participate. Where do you guys get this stuff about irrelevance? Ham radio
turns out
to be about the only RELIABLE form of communications available here during
disasters,
long after cellular phones and the internet are down. From experience, I am
absolutely
convinced, as are our non-ham community leaders and the Red Cross, that ham

radio
is an essential component of modern emergency and disaster communications in
North
Carolina. We have emergency power (generators and deep discharge batteries)
and can get
very creative to keep communications going when needed. I must characterize
your
statements above as being very naive with respect to actual real world
emergency situations.

1036. PB and PG v.1.4 - programs for communicating with Microsat satellites

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-11 00:00:00 UTC
From: Bent Bagger <bentbagger@my-deja.com>
Message-ID: <8adh57$83l$1@nnrp1.deja.com>
Source record: 13722

I have uploaded version 1.4 of PB and PG for Linux to Metalab.unc.edu.
The file
name is pbpg-1.4.tar.gz. I have placed the file and the accompanying
lsm-file in /pub/Incoming/linux. The target directory is
/pub/linux/apps/ham.
The file may also be downloaded from
ftp://ftp.amsat.org/amsat/software/Linux/pbpg-1.4.tar.gz.

The updated documentation is found in the file named README.

The following changes have been made since version 1.3:

- The programs are no longer installed SUID. This removes a security
hole that existed in previous versions.

- The build process is based on the use of the ax.25 library (ax25lib).
Use version 1.3 if you are on a version of Linus that does not
support ax25lib. If you want to remove the security hole from earlier
versions, change the two lines in Makefile that install the programs
to read:
install -g root -o root -m 0755 -s pb /usr/local/bin
install -g root -o root -m 0755 -s pg /usr/local/bin

The following is (still) believed to be an incorrectness:
- Sometimes PB will send requests for directory fills when it is not
needed. I have only seen this with AO-16 but it has been reported to
happen
with KO-25 as well.

The lsm reads as follows:

Begin3
Title: PB and PG for Linux
Version: 1.4
Entered-date: 10 MAR 2000

Description: PB and PG for Linux are program used for download from
and
upload to digital satellites (Pacsats) supporting the FTL0
protocol. This software allows you to directly communicate
with the Microsat series of satellites. It provides a
Curses (Ncurses) based user interface. It features automatic
directory fill requests and simple, rules based file
download requests.
This version of the programs will work with kernel
revisions 2.2.13 or higher.

Ham radio irrelevant (spelling corrected) to modern emergnecy and disaster
communications? Tell that to the sheriff's office in Carter County,
Tennessee. The emergency services of this rural county in NE TN were
overwhelmed by the impact of flooding in January 1998 in which 11 people
died and over 400 homes were swept away.

Had it not been for amateur radio operators who essentailly ran the county's
emergency communications for TWO WEEKS, there would have been no emergency
communications and the loss of life would have been greater.

And before you tell me about how everyone now has cell phones, let me invite
you to southern West Virgina where I defy you to get a cell phone signal in
the areas that are most subject to natural and man-made disasters. Then I
will remind you of the experience after the crash of TWA 800 where the local
cell networks were overloaded into near uselessness by emergency traffic.

Throughput divided by bandwidth is not "philosophical".
It is simple physics.

> ... what I do care

First, one LandLine Lid suggests that we drop all decency provisions from Ham Radio in order to further alleged "emergency distaster communicatuions" needs that are hard to take seriously from a Lid who has run down Amateur Radio and Packet Radio for years, making it plain that he could care less about others, unless SAYING he does so will further his personal desires.

> Ham radio is essentially irrelevent to modern emergency and disaster

Then an even bigger LandLine Lid shows up to urinate all over the entire concept of Amateur emergency communications (and Amateur Radio) to support his "point" that Amateur tcpip should never be used to help people out in an emergency.

Maybe Brian's right though, and maybe that's why tcpip has never really been useful when paired up with Amateur Radio. For my part, I think Hams will get awfully tired of trying to make tcpip "fit in" with the hobby, once the Internet has been thoroughly taken for granted. Then we can finally move on to our own protocols, specifically tailored to the RF environment and the needs of the Amateur Radio community.

The current struggle to make the "square peg" of tcpip fit into the "round hole" of Amateur Radio will then be behind us. - And good riddance!

That appears to be a misinterpretation of the regulations. 97.3(c)(5) defines the modulation methods permtted for phone transmission. Digital is one of them. The only limitations placed on these emissions for the HF phone bands are in 97.307(f)(1)&(2). The proposed method meets those requirements.

Now there are further limits placed on RTTY and data emissions (300 baud, 1 kHz max occupied bandwidth), but that doesn't apply to phone emissions. Nowhere in 97.307 are those limits applied to phone band segments. They are only applied to the RTTY and data band segments.

This was previously pointed out to me by Jon Bloom of the ARRL when I mistakenly posted that the regulations didn't allow us to experiment with digital voice on HF.

I'd also note that the QEX statement you quote is incorrect in calling this 1800 baud. Each carrier operates at 50 baud. There are multiple carriers (36), but that's irrelevant to the baud specification. Baud is defined on a per carrier basis. This is the same as Clover II which uses multiple low baud carriers to achieve a high aggregate data rate.

This is irrelevant to the current issue anyway, because we aren't talking about a data emission, we're talking about a phone emission. It may, however, be a source of confusion at the ARRL.

I"ve cc'ed this post to w3kd as well.

Perhaps they are concerned about the requirement that complete technical
details be made available to the public and the FCC. Does the FCC have
to be able to monitor an HF mode before they will allow it to be used?

Don't bother it wouldn't do any good. I wouldn't know what good web page design was even if it jumped up and bit me :-)

I am not trying to get people to use digital voice on H.F. I only used H.F because the guy I experiment with lives out of VHF range, so we had to use a 40M NVIS link instead. The system has pretty much the same performance as the 39 tone modem used with ANDVT terminals.

The only reason I can see for H.F digital voice is for encryption and frequency hopping, which are not really relevant to Amateur Radio. Although I did have an interesting email telling me Amateurs should be using the same standard that will be used for H.F Broadcasting. Which appears to be some form of parallel tone modem with QAM and MP3 encoding.

There have been a lot of posts supporting wide bandwith modes on HF
and I'm very strongly opposed to those based on the obvious potential
for qrm to users of other modes.

Brian 'ole bean I got into ham radio to work dx and later I discovered
HF contesting. You don't do those above 30Mhz except for a bit of
dxing on 6m. That's the way it was all those years ago and ham radio
hasn't changed a bit for me. I have no interest at all in VHF/UHF ops
beyond the utilities it provides for neighborhood comms like the
machines and packet. I don't knock the hi-freq guys with their
soldering irons and computers at all, it's just not my thing and I
think I'm allowed to have my preferences, yes?

I hate to be the one to break it to you, but we've been able to hook Amateur Radio into the Internet for a little over ten years now, Einstein.

What followed was not a "GOLDEN AGE". In fact, the general level of interest in Packet Radio took a nose-dive about the same time that Amateur tcpip came into it's own. Figure it out for yourself. Can you say, "LandLine Lids"?

"Golden Age".... That's really funny!

>Perhaps they are concerned about the requirement that complete technical
>details be made available to the public and the FCC. Does the FCC have
>to be able to monitor an HF mode before they will allow it to be used?

There's nothing in Part 97 requiring that for a voice emission. But the method is publicly documented, same as with PSK31, Clover, or PACTOR II, so the point is actually moot. If the FCC will allow one, then logically it must allow the other.

I'd add as a sidebar that the HF RTTY/data regulations actually forbid in clear plain English the use of things like PSK31 , because it doesn't use one of the 3 permissible telegraphic alphabets. But the ARRL was able to wrangle a convoluted opinion out of the FCC to allow it anyway. [1]

Another case, the Hellschreiber modes are a form of FAX, which belongs in the phone/image segments according to the rules, but the ARRL has again somehow twisted interpretation of the regulations to push those modes into the RTTY/data segments. [2]

It seems that when the ARRL *wants* something to be legal, they have no trouble getting it declared legal, even in the face of plain English wording of the regulations which forbid it. But if they don't want something to be legal, for example the Kenwood Sky Command system, they'll do their best to twist the regulations to prevent it.

I'm suspicious that the ARRL is acting with ulterior motives with respect to digital voice on HF. I'm suspicious that they don't want it mixing in with their SSB Dxer constituency, and are trying to twist the rules to prevent it, or at least to make it as difficult as possible by claiming a STA would be required to use it. I hope I'm wrong about that. I hope it is a simple misreading of the rules on the part of someone at the ARRL (certainly not Jon Bloom). But I'm dubious.

Gary

[1] Note I'm a proponent of PSK31, but I think that the ARRL should have petitioned to have 97.307(f)(3) stricken to permit PSK31 and similar modes rather than attempting to use a dubious line of reasoning to circumvent the plain clear English wording of the regulation.

[2] I don't disagree that this is where the Hell modes belong, but again it flies in the face of clearly stated regulations. If the ARRL wants to alter the way HF bands are divided up, I'm all for it. What we have now is certainly a mess. But I'm not for this sort of devious back door twisting of existing regulations.

If we want a new sort of formal legal band plan, we need to hammer it out in public, and publicly petition to have it cast into the form of regulation. Personally I favor regulation of the form which says, "These are the band edges, stay inside of them, and have a nice day." instead of the by mode and by class balkanization we currently have. I don't think such micro management is good policy.

Dan, you were listening to the standard "party line" that can be expected of a typical "LandLine Lid". These people require such negativity, true or not, at any expense. There's no telling why they are sick this way, but a fact's a fact.

These people feel they must pre-suppose that all Hams are as clueless and worthless as they are. Self-sacrifice and the innate nobility to be found in most Hams who participate in emergency communications such as you speak of, are totally foreign to these "LandLine Lids". They cannot find that decency in themselves and so assume that nobody else can, either.

This newsgroup is infested by a number of persons who have obtained a Ham license but have little or no knowledge, feeling, or pride concerning Amateur Radio and their fellow Hams. Notice how the very worst of them profess an interest in Amateur tcpip? Tells you a lot about Amateur tcpip, doesn't it, Dan?

If you wish to remain in a time warp, by all means do so. But please
allow the rest of us to move on (i.e., don't knock us).

1060. Speeding up TS-440 TX -> RX switch time ??????

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-11 00:00:00 UTC
From: 106255.1565@compuserve.com
Message-ID: <38cbd204.29244547@news.compuserve.com>
Source record: 13746

I have been spending some time analysing the switching times on my
TS-440 to overcome a Pactor problem. It seems that it takes 20 mS to
swich back to RX and another 20 mS for audio to fully recover. My
problem is recovery from TX-RX.
I have tried to find the cause but the only time delay circuits are on
the RX->TX switching and not on the TX->RX switching. Most of the
supply lines stay on anyway. I suspect something holds the AGC but
can't find what.
Anyone else worked on this problem?

Ballpark SSB: 200wpm/3KHz = 67 words per KHz
CW is probably double that figure but, of course, CW requires many
operators to equal the throughput of one SSB operator. But if you
want to "extend the topic", we can factor power into the equation to
talk about words per watt per kilohertz which starts to sound
familiar, huh?

> Ducky wunnerful: I'll take the opportunity to "extend" the topic,

Well, American hams don't have time to stop arguing about ham radio
ceasing to exist on April 15 in order to invent anything. The German
hams seem to be excelling in digital data modes and the English hams
seem to be leading the pack in digital voice.

> that.

The only reason SSB is used today, is because SAC (Gen. Lemay)
adopted it, and rigs were manufactured in mass quantities. Else, Hams
would still be using AM and CW on HF.

This won't happen again, because military communications are mostly
incompatible, specialized, and not produced in mass quantities.

That means from here on out, all Amateur modes will probably be designed
by Amateurs. While CW and SSB will be around in a hundred years
(if just for nostalgia purposes), the digital voice vocoder will transform the
main operating mode, as Hams demand interference and propagation
adaptive algorithms. Remember, there's a few billion more people on the
planet since 1965, and crowding is going to get worse.

The time to start experimenting (the purpose of Ham radio) with vocoders
is now. Charles Brain has used the best chip there is, and a very sophisticated
modem. I look forward to the articles.

Charles, I believe your analysis is either flawed, biased, or both. While you rail against "Amateur tcpip" (sic) and "LandLine Lids" as the cause of the demise of amateur packet radio, you're completely oblivious to a number of more relevant issues.

What snuffed interest in amateur wireless networking was the combination of rapid Internet growth (via wired connections), the virtual inability of amateurs to deploy infrastructure even remotely competitive with what was happening in inexpensive commodity modems, and the absolute fixation of most amateurs with just shuffling bits around, rather than thinking about the *services*.

Packet Radio nose-dived when people figured out is was a square peg being driven into a round hole. The users wanted Internet; packet radio could not compete with the alternatives.

Let me get this straight -- you oppose experimentation on the HF bands then?

I cannot understand why experimentation is a second class citizen to
a ragchew. The other way around would be appropriate.

Used Lan-link for years, It will not run on Pent 11 ect.
Wtb any pgm to replace it. Can't afford New Kagold etc.
A dos vers would be fine, tho can use Win 95 etc.

TIA,
Albert, Wa3fib

Sure, why does that mean they can't have theirs, eg some spectrum
to experiment with... ? After all, you have yours to DX in.

That's very good Cecil, and very understandable simple arithmetic
which yields a real and positive numerical ratio. If what we're
looking for is spectral efficiency, which I assume is the case, modes
should therefore be compared with each other via this ratio of
effectiveness. It strikes me that in order to compare ssb, etc. with
digital voice modes on this basis we need to start with establishing
the ratio for ssb. What is the "ssb ratio of effectiveness" based on
thruput divided by bandwidth?
>
>
>> >The question

As if the FCC has any interest whatsoever in "quality" . . never mind.
While we're at it how do the physics quantify "quality" and where does
the "quality" term show up in the Ratio of Effectiveness equation and
what are the variables and constants in that term?
>
>> That brings "philosophical" issues into the game.

Ducky wunnerful: I'll take the opportunity to "extend" the topic,
thankew. I gotta live long enough to see the collection of NCTA HF
digital comms proponents in this NG get off their dead butts and make
any new digital thingey actually happen anywhere on any ham band. Like
by putting as much time and effort into talking the FCC into allowing
the subject digital mode to be tested on HF as they have invested in

the code test issue. Hot air being worth two cents per cubit and all
that.

I'm not at all opposed to experimentation as such. I'm opposed to
reallocating meaurable chunks of mainstream ham HF spectrum space in
order for the few experimenters to do their thing at the cost of
interference and reduced space for the already overcrowded premiere HF
segments. The history of the introduction of new modes into ham radio
is a litany of sucesses accomplished within the confines of existing
regulations and in fair competition with other modes digital and
analog in the real world. PSK31 is just one example. You digital types
need to quit babbling about it, cut the Internet "discussions" and put
it on the air and let the cards fall where they may.

Have you listened around 14.060-080 lately? We "digital types" would
really do with some more bandwidth right now. In that band,
we have PSK31, Hellschreiber, PACTOR, and some QRP CW, all fighting
for a spot. PSK31 is confined to about 2 kHz of operation -- which you
might think is plenty since it only requires 50Hz channel separation
in theory -- until you actually try it and find that any strong station
near where you're listening will completely wipe out a weak signal
unless you have super-narrow IF filters because of AGC.

And MT63 has no proper home at all.
And at the same time, there's all of about 120 to 350 (minus a bit
for SSTV) for SSB ragchewing/DXing. And not used very efficiently
in comparison to the digital modes.

So if you don't want any space set aside, OK but don't expect your
daily net frequency to be clear and don't expect a digital mode operator
to move. I think a little more digital space would be ideal, especially
so PSK31/Hell doesn't have to share with QRP CW and PACTOR, neither
of which they are compatible with.

>
OK, sounds sorta reasonable to me but maybe on the low side. My
experience with ssb indicates that I don't need 3khz. The stuff is
still quite intelligible when squeezed thru a good 1.8Khz filter. Not
quite hi-fi results of course but it works when condx get difficult.
That would put the ssb Ebw ratio at 111. For the sake of this
discussion let's compromise and call the bandwidth 2.4Khz thus the Ebw
becomes 83. The Ebw for the Brit's mode would be 200/2.7 or 74 if I
did it right. Which, as far as I'm concerned makes the Ebw discussion
moot, they're even up for ham radio purposes.
>
The discussion now becomes how well would the subject standalone
digital voice mode perform under real operating condx? Will it dig
into the mud and crud in the noise as well as PSK31 and Pactor II do?
If yes it would be a huge improvement vs. ssb. What happens if two of
these digital stations are transmitting on say 500Hz centers at around
the same low signal strengths which is a very common occurance on HF
with all modes?
>
SSB is usable under these condx, NBFM is not as was demonstrated
decades ago thus NBFM was abandoned and HF ham radio moved to ssb. Any
HF digital mode will have to be able to survive the assorted
floggings on 75 & 20m phone and come out on top to go anywhere.

Yo, of course I'm not opposed to experimentation. I've previously
stated that this new mode should be tried. I'll concede that my
mindset is such that I personally can't be bothered with
experimentation unless it has a basis in good physics and a visible
bottom line and leads to meeting some practical need. I don't have the
time or inclination to tinker just for the sake of tinkering, I don't
have much respect for aimless techo diddling, For better or worse
that's a pretty typical engineer's values
>
All I'm saying is that from the standpoint of rudimentary arithemetic
and some wobbly assumptions this new mode doesn't appear to be much
different from ssb wrt to spectral efficiency. Which is no biggie one
way or another. Maybe it has advantages and/or attractions in other
directions. Or weaknesses. Given that the obvious next step is to put
it on the air and wring out V1.0 in the real world. Which is also
standard engineer's "behavior". Bring it on, get it on the air, let's
see if it can cut the mustard, I don't have a problem with that.

If you don't have enough time to tinker, fine, you and the majority of most Hams are operators, and want to know as much about your radio as you do about your microwave oven. But it's the experimenters who are producing your appliance. Do you think the DSP gadgets in your shiny new rig were designed by Japanese engineers? No, they were designed by Hams, and then incorporated, after being tested by many Hams who do like to experiment, and are excellent beta testers.

> Nor do I have a problem with HF digital tinkering vs. serious

That's pretty much the ARRL attitude: status quo, autopilot on, damn the icebergs. The iceberg in this case is the WARC. Americans are sitting on their hands as the "new world order" is about to take the Monroe Doctrine and shove it up your ass.

Steve

1. SSB did not win on spectral efficiency, it won because QSOs were being done on the high side of 20 when they were not being accomplished at 14.205 in Kilowatt Alley. SSB certainly meets the criteria for good physics and a visible bottom line. It also wins because it will withstand mistuning, selective fade, and a certain amount of QRM and still transmit intelligence from one human mind to another. I recall hearing a fellow that no matter how he was tuned sounded like Donald Duck with a headcold; when I met him at the local club he still sounded like Donald Duck with a headcold. The biggest challenge to digital phone is to stand non-zero-beat tuning and partial clobbering.

2. The SSB revolution required the electronic community to learn and relearn such concepts as linear amplification and such operating concepts as proper levels for the task at hand. They have not been totally learned on the ham bands, are an absolute disaster on CB, and from the postings plague digital modes as well. Conceptually SSB is really great but it had its problems until the supporting cast caught up. Having great lead singers for Aida is OK but the opera needs elephants and spear carriers as well.

3. The SSB transceiver has become the basis for the shack for any number of good reasons. SSB was good enough to make things like Collins KW1s into boat anchors. The digital community apparently does not believe its

offerings can do that and limits itself to pushing audio thru mike jacks and plugging decoders into speaker jacks with all of the resulting impedance matching and level-control problems one can expect from the binder-twine approach. If the proponents are not ready to build or buy equipment more suitable to the purpose, why should I care?

4. It may well be that spectral efficiency can be obtained in other ways. The Collins SSB system had competition from a DSB system from GE that could not be made to work with tube-era technology. Ever tried to build a full wave bridge with tube rectifiers? It has reared its head again with the idea that even if it takes 6 kHz width itself the system allows overlapping of stations and sorts them out via synchronous detection. It has not been an outstanding success with analog but might be sex-on-a-stick for digital modes. If you must experiment, do so but don't limit yourself going in to SSB compatibility. At some point, as with software emulators, you do have to do the real thing.

Sally forth -- and run the risk of coming in fifth. Of such is advancement made, not talking about it. True FM was not feasible for many years; when it was finally done it was found that the 6db per octave preemphasis of PM was actually an improvement -- so now some stations use true FM with artificial preemphasis. Such is life in the North Woods.

PSK31 Frequencies

I have been active on PSK31 for a few months and have had qso's
on 80M, 20m, 15M and 10M. I have not heard any PSK signals
on any of the other bands. Can anyone please advise me of any
PSK activity/frequencies on bands other than 80/20/15/10 M.

Does PSK count?

You can do it too. Just takes getting off YOUR lazy butt and putting
forth some "effort" and "serious determination".

: Like
: > by putting as much time and effort into talking the FCC into allowing
: > the subject digital mode to be tested on HF

Does it even -have- to be approved by the FCC? The "code" will be
published, the "code" is NOT used to encrypt what is being said, B/W is
acceptable for the information, etc etc.

: > as they have invested in
: > the code test issue. Hot air being worth two cents per cubit and all that.

: The only reason SSB is used today, is because SAC (Gen. Lemay) adopted it,

Maybe by the military, but civilians and commercial users were using it
much earlier.

; and rigs were manufactured in mass quantities. Else, Hams
: would still be using AM and CW on HF.

So by your reckoning, hams bought old military SSB rigs and put them on
ham freqs. ;-)))))

: This won't happen again, because military communications are mostly
: incompatible, specialized, and not produced in mass quantities.

Depends upon what you call "mass". We never refused a military contract
for 1000s of radios!!!

: That means from here on out, all Amateur modes will probably be designed
: by Amateurs. While CW and SSB will be around in a hundred years
: (if just for nostalgia purposes), the digital voice vocoder will transform the
: main operating mode, as Hams demand interference and propagation
: adaptive algorithms. Remember, there's a few billion more people on the
: planet since 1965, and crowding is going to get worse.

And PCAs will tell us those people will naturally learn CW so they can communicate while walking down the street. :-)

: The time to start experimenting (the purpose of Ham radio) with vocoders
: is now. Charles Brain has used the best chip there is, and a very sophisticated
: modem. I look forward to the articles.

Sounds interesting.

I understand that X1J digis send a fixed string at the beginning of the data, so that the "!" APRS Data Type Identifier may be shifted from its usual first character position (by up to 39 characters).

Can someone please tell me the nature of the X1J fixed string. What data does it contain? What characters can it contain? Must not contain? Examples?

I'm working on an APRS decoder program, and I need to know how to unambiguously recognize (and ignore) X1J strings.

There is no "It". There are just lots of cooperating servers,
exactly the same as the Ham Radio store and forward network.
Some servers will return an "undeliverable" message, some will notify,
and some will do nothing at all ... in BOTH networks.

Please visit the clue store for further details.

Brian,

I have started that topic in order to puch all of us, "digital" hams, to think about the future of ham digital communications, regarding all those professionals. And you talk about our 'eclipsed services'. I wonder who is responsible for a fact that ham digital area has been moved to margins, regarding your attitude? Maybe our out-of-date rules and regulations that don't allow anybody to run amtor, pactor, clover etc without Morse exam. That's why I suggested not to wait for ham digital areas to become completely abandoned in next few years (look at packet activities now when compare ten years ago), but to remove obstacles that lead new people to join Internet instead of ham radio communications.

>ampr.org and the amprnet are primarily for research, development, and
>recreation. It should not be depended upon for production or safety use.
>- Brian

Not sure if I understood that properly (my english is not native). What is the problem if 'amateur' research and development within digital area, for example in this actual mailing list and/or newsgroup, result in some high-tech 'professional' usage? If we allow so many students, engineers etc to join ham digital radio and develop themselves further, it would be as good for them as for wide community as well.

Most mail programs will send all mail to a single configured SMTP server,
not to the recepient's server. They will let that server do the tricky
work. It may or may not send the message to the recepient's server,
depending on how that server and the recepient's domain are configured.

The situation is indeed not much different from packet radio, only the
typical number of hops is less. There CERTAINLY is no delivery guarantee,
nor is there an error notification guarantee.

I think one possibility is to petition to the FCC for individual HF frequencies. These new frequencies do not have to be continuous, and can be spaced all over each band. Then these frequencies can be used as part of a frequency hopper, or multiple tone/carrier modem. It would keep the "status quo, autopilot on, damn the iceberg" contesters and DX chasers out of the equation. I'm talking about digital transmissions over long distances, with few intermediate nodes.

Brian lives in an area of the country where the biggest disaster is two SUV's colliding into a Taco stand, and no one being able to speak the same language.

Out here in the real world, Ham radio is very active in both disaster preparedness, and disaster response.

My only gripe, is that it reminds me of the old way we used to conduct Air War. We would set up a couple of packages inbound, the enemy would respond, and all hell would break loose on the voice radios. My old radar plane had at least 4 radios per controller (check in, tanker, striker, intercept, etc, etc). Today, more than half the data is digital symbology right to the driver, and the voice freq is short calls (break right, fox 1, etc, etc).

I think APRS is that datalink, but it is too unsophisticated to handle large amounts of data. In an Air War the data is in 100's of k bits per second, rather than 10's of bits per second. With each storm having at least 10 to 20 spotters out in tornado alley, the voice repeaters and net type operations are highly stressed.

Probably because I have a life. Read the RFC is my answer, get
a Unix box and watch, is another possibility.

> There are NO "guarantees" Steve, none at all, in either network.
> It is all "best effort".

I didn't say there was grandpa, I mentioned that packet BBS has no
mail receipt, and that SMTP mail does. I didn't propose a statistical
summary, or technical essay on why this may not occur. I was making
it a distinct possibility as to why the ARRL or any Ham club doesn't
use packet radio BBS as their Ham mail distribution system.

> If you think there are "guarantees" ... quote the RFCs instead of

services.

This may hold true within the LandLine Lid community, but not elsewhere.
Remember that the LLLids are the only ones worried about "competing" with
the Internet. Everybody else has got more sense than that, and realize that
Packet was never intended to "compete" with commercial, non-ham
communications services in the first place.

>
> Packet Radio nose-dived when people figured out is was a square peg being
> driven into a round hole. The users wanted Internet; packet radio could
not
> compete with the alternatives.

Nice theory, but unfortunately it doesn't fit the facts. The folks in Europe
actually average having faster Internet access than most Hams in the USA,
and yet the introduction of cheap, easy Internet access had no serious
effect upon the gropwth of their packet network. Ours network in the US lost
participants in reaction to negative anti-Ham propaganda foisted upon US

hams by the LandLine Lid community. Fortunately, US Hams are quickly learning to ignore LandLine Lid negativity and build a network anyway. - One that ALLOWS tcpip, but is no no way based upon, or limited by it.

Really, that worn out old catch-phrase about "competing with the Internet" is about as obsolete as the "applications mantra". After hearing the LandLine Lid community parrot the same tired old lines over and over again for better than ten years, I, along with many other Amateurs have learned to simply tune out the negativity and anti-ham sentiments - Which leaves the LandLine Lids at a loss, as that appears to be all they have going for "going" for them, in the long run.

Intentional or not, packet most certainly found itself competing with the
Internet (I'm going to simply ignore your specious and irelevant reference
to "LandLine Lids").

I believe you're quite ignorant of the Internet access situation in Europe;
as far as I can tell, most Europeans do not enjoy the inexpensive flat-rate
telephone calling that most Americans do. Europeans generally pay by the minute
for every phone call, including Internet access.

> Ours network in the US lost

Blame those nefarious "LandLine Lids" and their evil tcpip (sic) all you want,
I believe you're refusing to see the real issue. The *users* of that mythical
network you keep talking about simply aren't there, and it isn't because the
"LLLids" ran them off.

> Really, that worn out old catch-phrase about "competing with the Internet

> "going" for them, in the long run.

Well, if a network doesn't exist to serve some kind of application(s), then
what does it exist for?

Amateur IP has not driven the users away, the users have found a better alternative.
Last month, I spoke at a local club meeting, and I asked to see a showing of hands
of those that had ever been active on packet; most of the amateurs raised their hands.
Then I asked how many are currently active on packet; a small number did so, and they
were mostly active on APRS. Of the majority that had been active and given up, the
general reason given was they've found the Internet is better for what they wanted out
of packet. Not a mention of IP or LandLine Lids, Charles, just a bunch of people that
found the Internet gave 'em what they wanted when packet did not.

One way to go would be to skip the TNC altogether. Got a PC running Win98 and
an SB compatible sound card installed? Then try:

>that be in violation of FCC regulations?
>
>73, Mark KF6KYI

Nobody ever said that the FCC regulations make sense. Though in a way
they do. The intent of the baud limitation for HF data transmissions is to
keep the occupied bandwidth small in order to be compatible with the other
users of those band segments (mostly CW operators). But that rationale
doesn't apply to phone transmissions. They're wide anyway. The FCC
has sensibly crafted 97.307(f)(1) to say that any phone emission must
not occupy a greater spectrum than A3A (6 kHz). Mention of baud in
that context would be irrelevant.

Besides, no one would really want to use a baud above about 50 on HF.
Otherwise skywave multipath kills you. That's why the high rate systems
operated on HF use multiple low baud carriers.

Running data in the phone bands is illegal. Data transmissions are
limited to the data band segments of our HF bands. But digital voice
is not a data transmission. It is a phone transmission permitted under
97.3, and thus is subject to the phone band segment regulations, not
the data band segment regulations.

There will be some effect on pattern at that spacing. But the more
serious problem will be the fundamental overload the TV sets will
suffer with this close a coupling of the amateur transmitting antenna
to the TV receiving antennas. You're going to have a *lot* of overload
induced TVI. I'd suggest a minimum vertical separation of 10-12
feet would be needed to reduce this interference to a tolerable level.

The Land Line Lids might have thought they were competing with the
internet, but most hams did not and do not. It is about RADIO, not
about PROTOCOLS or about COMMUNICATING. Duh ...

You seem to one of those guys that miss the meaning of posts, and tries
to talk about things they know nothing about. By the way - it is
TCP/IP, not tcpip; and the first golden age I was referring to was when
HF really was a more useful communications medium.

What is your agenda, man? You are really out there. Come on! You can't stop TCP/IP or the Internet... it WILL win!

To make TCP/IP "fit" in the Amateur Radio Service we just need to communicate at a decent speed. 1200bps isn't gonna cut it. 1200bps played right into the hand of the control freaks. I bet you used to run a PBBS or a NET/ROM node or two, right? Well, with TCP/IP and the Internet, we can make a nice end run around those silly old technologies AND the control freaks who ran them.

Let me try to 'splain something to you - Ethernet(the main underlying system that help support the explosion of the Internet and TCP/IP) IS an RF environment. TCP/IP is PERFECT for hi-speed packet networks.

Now that a lot of folks are getting full-time hi-speed TCP/IP network connections in their homes - we have a good chance at reaching critical mass. The Kenwood TH-D7A helps - 9600bps makes TCP/IP usable for non-Web Internet apps. Now, if somebody could start selling 56Kbps WA4SDY modems, and the associated support h/w(I/O cards and transverters) at a decent price, we would be in really good shape. TAPR seems to be stuck in the mud with their CDMA stuff.

Thanks to everyone who responded with helpful suggestions about our telescoping TV mast. With your help, I was able to begin tackling the job with confidence.

This afternoon, I got my brother to come over and help(it really is a two-man job). My mom was a great help too, as she kept my dad occupied with the dinner he was cooking - otherwise it could have been a real disaster.

A lot of folks suggested heavy work gloves - and they did come in handy! We collapsed the lower two 8' sections, and I decided to stop there, as evening was approaching and I really needed to go to the hardware store and pick up some replacement hardware. It is a 40 year old mast, and handn't been serviced in at least 20 years; so a few rusty old bolts stripped, and most of the feedline-holding hardware disintegrated upon removal as well. Thank god I don't live in an area with more harsh weather conditions.

So for now the TV antenna is at 24', instead of 40'; so my parents still have decent TV reception - and my dad won't go ape. I removed my VHF/UHF dual-band omni antenna from my rural home in Riverside County - and will install it here in urban San Diego on the mast, when I replace my old man's broken rotor. I'm looking forward to seeing what kind of coverage I get. I have a place in Rosarito, Mexico also, and I'm hoping to be able to network my two places thru the omni here by putting beam antennas in Mexico and Riverside County.

I'm getting ready to mount my Diamond X-300 dual-band VHF/UHF(144/440) hi-gain omni antenna on the top of a 40' telescoping TV mast. There are existing VHF & UHF TV antennas on the top of the mast that I'm going to lower about 3 feet from the top of the mast. The thing is - because these TV antennas will be in close proximity to the ham antenna, and because the TV antennas work in bandwidths that overlap those of the omni - will these antennas have a large effect on the antenna radiation/reception pattern of the omni? If so, how badly will it be affected?

Watching the behaviour of a Unix box hardly does anything towards proving
that the Internet mail system is a "guaranteed" service...

>> There are NO "guarantees" Steve, none at all, in either network.
>> It is all "best effort".

>I didn't say there was grandpa, I mentioned that packet BBS has no
>mail receipt, and that SMTP mail does.

But you are wrong. Many BBS systems provide for a mail receipt, and none
is required in the SMTP standard. Voluntary standards to support it do
exist, like in the BBS system. And different systems do it in a different
way, so you sometimes get receipts about mail not yet delivered to the user
or even not yet delivered to its final destination. It may be lost after
you got your receipt.

But there exist many Internet providers that don't have monthly and hourly
fees, but are completely free as observed by the user. (they actually get
part of the phone call rate)

For light users, this usually is less expensive than signing up for
flat-rate telephony plus paying for an Internet provider.
(off-peak phone rates are well under a dollar per hour over here)

For those that want to be connected 24h/day, something which I would
consider a gross mis-use of a flat-rate telephone line, there exist
alternatives like cable-tv Internet, ADSL (now being rolled out), and
classical leased lines.

Of course. This whole thread is about the "glories" of digital voice
radio, I'm at best only mildly interested in the whole topic in both
it's voice and teleprinting varieties. I'm getting leaned on for not
being "excitd" about any of it, it ain't my thing and never will be my
thing. I beep dx for the most part so forget "shoving the stuff down
my throat" and I ain't making any bones about it. I'll try some
digital radio. When I see some of these upcoming 5wpm digigeek
Generals beep anybody I'll have more respect for what they actually
know about HF ham radio.

You're missing the point shithead. The new Generals won't beep anybody
because they took the 5 WPM test and promptly moved on. CW is not
what is attracting new Hams. No matter how important a measuring stick
it is in your childish brain, CW means nothing to them. You can't shame them
into working CW. They will look at you like the idiot you are.

The only way they will ever work CW, is if you respect them, and welcome
them to your interest. If you act like CW is the end-all, then who can blame
you for not having any new Ham friends.

Linux has kernel support for AX.25 with drivers for sound cards,
Baycom, YAM, etc.

Flexnet is useful. Baycom have all kinds of neat (and cheap)
goodies. There are others - anybody?

Buy an external box if you must, but doing it in software is
cheaper and often works better.

I am a bit confused by this. Doesn't this radically blur the distinction between digital and voice modes? It seems pretty silly to limit datarate for digital communications when the data rate for phone isn't so limited. Imagine that I used some form of steganographic encoding for voice that allowed me to superimpose a data channel (perhaps as some kind of power control signal for instance). Would that be in violation of FCC regulations?

It's not datarate per se, it's bandwidth. The bands are essentially
divided into narrow bandwidth modes and wide bandwidth modes.

I think you are referring to the Hamcomm 3.1 software. Hamcomm will NOT work with ANY TNC. Hamcomm 3.1 only works with a simple Hamcomm hardware interface using an OP amp(or a piece of hardware that simulates a HAMCOMM hardware interface).

The PK-232 does NOT simulate a Hamcomm hardware interface.

I suggest you try one of the many other pieces of software designed specifically for the PK-232. Some are freeware. Some are shareware. A good shareware program for the PK-232 is XPWARE for windows at www.xpware.com

Hi,

As some have pointed out, you can use a PC with a sound card and the SV2AGW packet engine for packet. Works well. You can also use flexnet with a sound card and a PC. (A lot of Hams do not like FLEXNET since it dynamically changes the TNC's timing parameters to adjust to the traffic on the channel. Some say that FLEXNET adjusts the TNC parameters to favour stations with string signals over stations with weaker ones).

SV2AGW appears to be the way to go!

But there are advantages to a dedicated external TNC. If you want to keep your packet station on all the time to receive packet mail, all you need to keep on is your radio and a TNC with a mailbox built in. You do not need to keep your computer on.

The KPC3 is popular. I have one. It works okay. But in hindsight, I probably should have bought the MFJ TNC. The MFJ TNC uses the standard NON PROPRIETARY host mode called WA8DED that allows programs running on the PC to take advantage of all of the features of the TNC easily.

There are many many packet programs to choose from that uses the WA8DED host mode standard.

The PK-12 and KPC-3 use their own host mode. There are NOT nearly as many PC programs to choose from.

For GPS applications, an external TNC also has some advantages. The KPC3 and KP3PLUS have very good firmware for GPS. You do not a PC for you to send GPS data with your KPC-3 and radio (e.g when travelling in a car or on a bike).

I do not know whether the firmware in the MFJ units support GPS. If that is a consideration, you may want to ask MFJ.

The first question to ask yourself is what you want to do packet radio -- then choose the TNC or software for a sound card.

What about those of us who are both builders and operators? Who use homebrewed gear on the air all the time, for serious operating?

>But it's the experimenters who are
> producing your appliance.

Nah. Most of them are designed and produced by Japanese professionals. There are exceptions like Ten Tec and Elecraft, but look in most US hams' shacks and you see lots of Yaecomwood stuff.

The average modern day radio amateur does not want to, or simply cannot, invest the time, effort or resources needed to design and build radio gear from scratch. There are some of us who do build our stations, but we are the exception, not the rule. From what I've seen, the most popular HF construction projects are QRP CW transceivers.

Look at most of the digital experimentation, and it's NOT about building radios. Rather, it's about building devices to hook onto a manufactured rig in order to use a new mode. That's why amateur packet is stuck at such low data rates - you need a purpose-built dataradio to go significantly faster than 9600. That's why Pactor and PSK31 are hits - because you can hook a box to the audio lines of a conventional rig and make it warble. Ingenious, yes, but also performance- and creativity-limiting.

What rigs do YOU use, Steve? ;-)

> Do you think the DSP gadgets in your shiny
> new rig were designed by Japanese engineers?

Well, I don't have any of those JA rigs, but yes, that's where most of them come from. You think dropping the code tests is going to change that one iota?

> No, they were designed
> by Hams, and then incorporated, after being tested by many Hams who
> do like to experiment, and are excellent beta testers.

The manufacturers saw some hams using audio DSP, figgered it was a new
thing to put in their rigs, and did so. As it has been since spark days.

But most of the current DSP rigs use IF DSP. How many hams built rigs
with IF DSP before the JAs started doing it?

Not by their actions. If they think that way, WHY publish the digital
voice article in QEX? WHY publish QEX at all?

> The iceberg in this case is the WARC.

Umm, Steve, they call them "WRC" now. Last WARC that affected hams
seriously was 21 years ago.

> Americans are sitting
> on their hands as the "new world order" is about to take the Monroe
> Doctrine and shove it up your ass.

How? The most credible threat to the amateur spectrum status quo is
loss of VHF/UHF to other services who are overcrowded. There are other
threats, of course. How will digital voice on amateur HF make any
difference to any of them?

Wonder what the FCC will do when hams want to use a multi-function
mode that supports both voice and data? - like commercial GSM does.

> the data band segment regulations.

The distinction between phone and data in digital phone is completely
arbitrary however. You could be passing voice on that data channel, or
just as easily could be passing (say) control information, or even transferring
data messages. It matters not at all to the modem. The occupied bandwidth, power
etc... are all identical in both cases. It seems nonsensical to make any
distinction in legality in this case.

What does this have to say about the legality of MT63, a wide (1khz or 2khz) data
mode? It uses the phone band for data communications, at a fairly wide swath of spectrum
space. Just curious...

I'll second the motion for Linux,

Just setup my first Linux box (Red Hat 6.0). Sure there's a bit of a learning curve, but the potential is awesome and not just for packet. About anything ham is fair game. With the newer distributions, the curve isn't near what it was 2 years ago - when last I looked and bailed.

So far been getting APRS stuff setup (xastir, Xaprs) - next will be at least a sat tracking package. There's a LOT more out there to be had. For chuckles going to try DosAPRS under DOSEMU - we'll see.

If you're sitting on the fence trying to decide whether or not to dive in, here - lemme push you over. Water's great.

Um, yes, now that you mention it.
That's what I did for a living before I retired.

Nothing to do with SMTP or MX records ... just with server settings.
SMTP is a protocol used to move email from one place (client or server)
to another place (server). An MX record is a HINT or SUGGESTION
of how email MIGHT be routed to a particular email address.

(Found that info on the very first shelf near the clue store door).

Note that all that obfuscation you provided says nothing at all
about what should (or even what can) happen when a message
cannot be delivered. SMTP does not handle this, MX records
say nothing about this. The user can request specific handling,
but the actual handling is at the discretion of any of the servers
in the path between the sender and the eventual recipient(s).

There are NO "guarantees" Steve, none at all, in either network.
It is all "best effort".

If you think there are "guarantees" ... quote the RFCs instead of
babbling about protocols and address translations.

> "it" is the SMTP server you point at with your Browser mailer, etc. Don't
> care about how your BBS does it.

"it" is any number of servers, whatever protocol they use to talk to
each other. SMTP is the most common, but if you think it is the
only way servers exchange email ... you are clueless.

> use packet radio BBS as their Ham mail distribution system.

It is clear why the ARRL does not, as others pointed out.
Some ham clubs do in fact use packet radio as the means to
distribute their newsletters. Why continue to denigrate Ham Radio?

> > If you think there are "guarantees" ... quote the RFCs instead of

>
> Cute. You're beginning to wear me down grandpa...

Thank you for the sobriquet honoring my long experience!

You failed to quote the RFCs.
Wonder why?
Want a URL so you can find them?
Aw heck, here is a clue, free of charge: http://www.isi.edu/in-notes/
All the RFCs, STDs, et al available to read.

Which one tells about guaranteed delivery?

Well, if they actually wrote the rules that way, it would be Ok. But they
didn't, they invoked other factors which are both overly restrictive to
amateur experimentation, and irrelevant to the objective of dividing
usage into wide and narrow mode segments. If the rules said, "These
band segments can't use an emission wider than 1 kHz, and these
band segments can't use an emission wider than 6 kHz", and left it
at that, we'd have a livable situation.

You probably should check the Timewave page for the updated firmware for the DSP-232 which will let it do Pactor. Also they have a trade in program for the buggy DSP-232 to be changed into a PK-232/DSP.

We've done some work with PK-Term '99 to work around as many firmware problems with the DSP-232 as we could. You can upgrade from your PcPakRatt Software to it for $50. Details at http://www.cssincorp.com/pkterm

1155. Marine Radio Control for ICOM M700 pro and M710/710r PRO now available

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-14 00:00:00 UTC
From: Rick Ruhl - CSS <ricker@cssincorp.com>
Message-ID: <OOsz4.5051$T54.108884@news3.mia>
Source record: 13789

Marine Radio Control, Release 1 for Windows 95, Windows 98, Windows NT and Windows 2000 available now.

Muscle Shoals, Alabama. March 10, 2000 Creative Services Software announces MRC, Release 1, a new 32-bit radio control program for the ICOM M700 PRO, M710 PRO and M710 PRO-R, is now available. The program retails for $49.95 and will include an interface cable that will work with the NMEA interface in these radios.

This new product will allow mariners and hams who have these ICOM radios to control them remotely from their computer. It makes tuning these radios as easy as using a VFO on other radios. From the program you can change transmit and receive frequencies, set the mode, and tune the antenna on the fly.

Free 1.x upgrades will be available for the product.

It runs under Windows 95, Windows 98, Windows NT and Windows 2000.

Creative Services Software is on the web at http://www.cssincorp.com

Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation.

Steve managed to paint himself into a corner with his mindless anti-BBS rant again, most of which he picked up from his buddies at TAPR. I've seen him make this same mistaken claim several times in the past here, and I've seen him being corrected on it several times. No "learning process" appears to have occurred.

It seems that Steve has found himself to be most comfortable as a LandLine Lid by simply ignoring any inconvenient or embarrassing facts. This steepens his personal "learning curve" to the point where fresh insight or a broader view is not very likely to occur. A good TAPR man.

At some level, even Steve knows that the standard repertoire of LandLine Lid anti-BBS propaganda is so much crapola, but he parrots the same tired old lies and half-truths over and over again anyway, lacking the imagination to come up with fresh lies, and lacking the character and self-respect needed to show any preference or respect for the truth.

Kind of like the deal with European Internet access... The fact that European Hams did not throw up their hands and give up on Packet Radio because of the Internet is MOST INCONVENIENT to the average LandLine Lid or TAPR goon. They simply MUST BELIEVE that European Hams do not have Internet access, and they must parrot this "party line" endlessly, no matter how often they hear that it's simply wrong - from European Hams.

It's just not convenient for Steve to display an ability to understand these issues because he knows that he is wrong, and to display even average objectivity and intelligence would inevitably lead him to the position of having to admit that his precious "party line" is a series of misleading half-truths and good old-fashioned lies.

Remember the "Applications Mantra", debunked in the article below? More of the same.

http://www.texoma.net/~n5pvl/appsman.htm

Steve's intellectual bankruptcy is common to the LandLine Lid folks. So is his negativity and constantly expressed anti-Ham sentiments, and his often expressed dissatisfaction with the requirements for decency and non-commercial operation laid down in PART97.

As a LandLine Lid, Steve cannot help displaying the crippled intelligence and defective character the role he has chosen requires.

Personally, I think he's a perfect representative of the LandLine Lid set, and would make a great LandLine Lid "poster boy". Many times, Steve's posts have been invaluable resources for me when pointing out just what is wrong with LandLine Lids, and their alleged "reasoning".

There is nothing wrong with Charles' analysis you just have to understand the basis.

I first ran into Charles when I sent him a private note pointing out that an earlier communication of his to this list was typical of that which would be put forward by the stereotypical pompous elderly ham defending turf. Charles responded that I was obviously a LLLid and obviously did not understand the issue. I pointed out I was a reasonably well trained engineer, had a good background in the area, and had no particular preconceived notion of the issues involved.

Charles responded that I was obviously an LLLid and should get a life.

I responded that Charles had no knowledge of any position I had taken and therefore should not tar me with an unfounded brush. (Other than Charles' behavior was close to the old ham stereotype.) Charles responded with a blank mail note (maybe so hot it was censored by a tcpip node?)

I therefore suggest that, even though he is not old enough, Charles be declared the Amateur Radio Pompous Ass of the New Millennium. We should all refer to him as ARPA Charles until a suitable successor rises to the role and dethrones him (or the joy of the appointment overwhelms him and he resigns his ham license.)

Jim KO6MH - who is leaving for a few days/weeks after launching this benediction.

Don't forget to mention that "9600 baud ready" in an advertisement is not
much more than a wild claim that marketing put in to sell the transceiver.
Look at the QST test figures to see how ready it really is.

(evaluatew the figures yourself, the accompanying comments in the text do
not always agree with the raw measurement results)

But the FCC does. They classify modes by what sort of information they
carry as well as by how it is carried. They are only following standard ITU
practice when they do this, of course, but the micromanagement by band
segment is totally their own idea, and one that I find a bit dumb with today's
technologies.

>What does this have to say about the legality of MT63, a wide (1khz or 2khz) data

Under current rules, MT63 is illegal on our data segments and illegal on our phone segments of HF. The only place we can use it legally is above 50 MHz, where it isn't needed. Dumb.

Most any radio will work at 1200bps AFSK. The problem comes when you want to go at 9600bps FSK. Modern-day radio filters wreak havoc with an FSK signal, so you have to make sure you make a direct connection to the the radio's FM modulator varactor and FM detector.

To start you ought to go to the TAPR website and read good 'ol Mike Curtis' (WD6EHR) mildly amusing 9600 baud packet handbook:

http://www.tapr.org/tapr/html/pktf.html

The only problem is, this was written in 1994. Most of it is still very applicable; however, it does not cover the modern 9600bps capable radios that are being manufactured by the major radio manufacturers. It does mention the stock radios of 1994, like the out-of-production Kantronics D4-10(I have one, myself), and the TEKK KS-900(replaced by TEKK KS-960, and they have a 220Mhz version now, too).

As far as modern 9600bps capable radios, I have heard good things about the Kenwood TH-D7A(which also comes with a builtin TNC and APRS s/w).

But be careful - In the late '90s, the commercial radio manufacturers were quick to try to jump on the 9600bps bandwagon. They started selling radios that claimed to do 9600bps. They might have worked in the lab, but in the real world, they were a flop. One of them that comes to mind is the Icom 751(?). Personally, I don't know about the Yaesu FT-90 - a search on deja.com turned up only one question regarding 9600bps operations with the FT-90 - and zero responses or other information.

As far as modifying a modern radio to tap into the varactor and detector, that could get pretty hairy, so what a lot of folks did(myself inculded) was to buy old commercial radios that were easily converted to the ham bands, and that were coming out of service and available cheaply($50?). I have a bunch of old Motorola Mocom-70 and a couple of Mitreks. Once again, there is a bunch of information on this at the TAPR web site.

NOTE: The 9600bps bandwagon actually did get off to a creeping roll in 1994. We had a decent size group of people out here in Southern California(led mainly by WD6EHR). But then telephone modems shot up in speed to 28kbps(and then 56kbps), and their prices dropped to virtually nothing - effectively knocking the wheels off the 9600bps Amateur packet bandwagon. Now that people are starting to get full-time Internet connections in their homes, I expect to see a resurgence in 9600bps and TCP/IP activity(at least in the urban areas), as people access their fulltime Internet connections from their mobile laptops. 1200bps is OK for APRS, but that is about it. If you want to do much of anything, go for 9600bps, and help with the resurgence.

Oh, and if you are interested in 56Kbps operations, check out the WA4DSY site. To go 56Kbps, you don't use a regular radio, you actually "transvert" a 28Mhz IF signal to a higher ham band that allows the 80khz 56kbps MSK signal:

http://www.wa4dsy.net/

The closest thing I can think of is the TAPR TNC-2 documentation at
ftp://ftp.tapr.org/software_lib/tnc/tncdocs.zip.

The ORIGINAL version of this was copied for the MFJ documentation,
however the only available version was updated around 1992. The prime
differences are the removal of the MF-10 filter, upgrading the SRAM
from 16K to 32K and adding the additional commands in version 1.1.8a
firmware (this is a lot closer to the 1270 than the 1270C would be).
I'm not sure if the MF-10 was in the original 1270 or not (it had been
removed in the 1270B). I suspect that the 1270 had the equivalent of
1.1.3 firmware. The TNC-2 schematics are also available in the same
directory.

Source record: 13659

If 800x600 is low-res, what is 640x350? or 20x4?

Linux has, as part of its kernel, amateur radio AX.25 as a
protocol. There is also user functions to interface with the
kernel to perform such things as Netrom, Rose, and BBS.

This kernel code also works with sound cards, and has multiple
baud rates, of which 4800 would be an upper choice for
AFSK.

A TNC is a device that that acts like a modem, it takes the
audio tones from/to the radio, and translates them to RS-232
or TTL for use by a computer.

In this case, the computer for both processing the tones and the
packets, is the same computer that displays the data to the user
on a hi-res color LCD display.

Hope this helps,

Steve

>why it never sends FRMR; anyone remember this ancient history?

Sending FRMR often leads to pathetic cycles of re-connect, send some
packets, same error, FRMR, and all over again.

As conditions that lead to FRMR usually are caused by defective software
at the other end, it seems to be better to just be silent than to send
FRMR and tickle an area in that defective software that is probably even
less well tested than the main protocol.

I have not made any mods in NOS, but I remember well the days that the
AX.25 protocol handler in NET was changed by Phil to exactly conform to the
letter of the spec instead of to "Be conservative in what you send and
liberal in what you accept", and the resulting problems. I certainly
understand why some of that behaviour would have been changed, I did the
same in NET.

(another condition that often would lead to a FRMR in the official protocol
and will cause no harm when simply ignored: excessive buffering of packets,
e.g. in a KISS TNC, outside of the control of the AX.25 engine. this can
cause "long delayed packets" that arrive after a corrective action was
already taken)

Tony,

Could you provide me with a list of issues you've run into with PKterm. Many times we find that either the problems have been solved with a later release, or it's just a usability issue. Release 1.4d of PKterm is the most solid release yet and not only fixes some issues with the program, but also works around some problems found in the PK-232 and PK-12.

As I've said here before, many problems running the program with the DSP-232 is because of the issues in the firmware of that unit. The firmware issues have been acknowledged by Timewave, and have offered a trade in program for this units.

I do want to look and address YOUR issues with PKterm. After all, if there are problems, we want to fix them. If problems go unreported, they may never be addressed.

Free feel to post them here in USENET and/or email me direct.

best regards,

Asked a simple question, can you answer it?

> If 800x600 is low-res, what is 640x350? or 20x4?

"useless".

> Linux has, as part of its kernel, amateur radio AX.25 as a
> protocol. There is also user functions to interface with the
> kernel to perform such things as Netrom, Rose, and BBS.

Didn't ask that.

> This kernel code also works with sound cards, and has multiple
> baud rates, of which 4800 would be an upper choice for
> AFSK.

Where is the sound card?

> A TNC is a device that that acts like a modem, it takes the
> audio tones from/to the radio, and translates them to RS-232
> or TTL for use by a computer.

How does this device manage it?

> In this case, the computer for both processing the tones and the
> packets, is the same computer that displays the data to the user
> on a hi-res color LCD display.

How does it do this without a sound card?
Is there a SB 16 on the motherboard?
Are there slots?

> Hope this helps,

You didn't answer my simple question.

> Looked at all the pix real carefully too!

It has all it needs: a sound chip on the motherboard, ample
compute power, and the ability to run appropriate software.
Useful interfaces (parallel, USB, and the dmesg output says
that Linux thinks it has two serial ports).

Linux is handy in this respect: native AX.25, lots of useful
drivers (including the soundcard), and the price is right.

With AX.25 in software you don't need a TNC. Plug the radio into
the sound card, or plug a modern modem into the parallel port
(or the USB port if you want to get fancy) and let the software
do the rest. With a decent processor (which this unit has) you
won't notice 9600 baud packet, even if you do it with the sound
card.

800x600 isn't that bad - I'm using it right now because my cheap
used monitor (a nice one when it was new; junk now) won't go any
higher.

I want one.

I'm still mildly tempted to build a pedantic flavor of AX.25 for giggles,
maybe I can save the trouble by looking at ancient tcp-group archives?

> (another condition that often would lead to a FRMR in the official protocol

The relatively short sequence-number stream is certainly an issue here. X.25
was clearly designed for relatively reliable wired circuits, and certainly leaves
a bit to be desired in the translation to radio circuits, even relatively good
ones. Old news, I know, but I've been recently reminded :-)

Has anyone done 1200bps or 9600bps packet on FRS or GMRS? The radios have MIC and SPEAKER connections.

This would be a cool use for all those 1200bps TNCs gathering dust in the corner. Heck, you don't even need a TNC - most computers come with a sound card that should be able to do 1200bps packet. Kids would DIG being able to use their home computers to send e-mail over their FRS radios to other kids in their neighborhood. A few folks could set up some GMRS digipeaters or nodes and link a whole community! A GMRS base station could be a gateway to the Internet for those that have 24hr Internet access in their homes. Many possibilities exist here. And it wouldn't cost hardly anything!

It will really freak the kids out to hear those packet tones on their FRS radios. Totally cool.

1187. Re: $99 Modern TNC (LCD 800x600)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-15 00:00:00 UTC
From: Hank Oredson <horedson@att.net>
Message-ID: <lwRz4.3793$mf.271022@bgtnsc05-news.ops.worldnet.att.net>
Source record: 13673

The point I was trying to make is that this device is NOT
a TNC, much less a "modern TNC" (whatever that is).

It is just part of a computer.
(To make it useful one must add a hard drive and make other modifications).

The subject of the article was deceptive.
I expected to find information about a TNC.
There was none at the URL given.

I find equally useful computers (with hard drive and floppy already included)
available for nothing or next to nothing. $99 seems quite expensive for what
this device can do. If the subject had been something like "Not too expensive
flat panel display with useful electronics included" that would be different.

I remember in the FCC rules that only voice was permitted on the FRS frequencies. We looked into it a while back to find out of we could do a low cost FRS paging service.

I know, I have one :)

I'm working on getting my 10&12-year-old daughters licenses... It is going to be tough for my 10-year-old to pass, and without someone to talk to, my 12-year-old was starting to ask a lot of questions like "Why do we have to know all this stuff, just to talk on the radios?".
That is why I got them FRS radios - so they could at least start to have some fun and experience with radios, and hopefully it will act as an incentive for them to continue studying with me to get their ham licenses, eventually.

Forget it - I found the answer....

95.627 Emission types.

(a) A GMRS transmitter must transmit only emission types A1D, F1D, G1D,
H1D, J1D, R1D, A3E, F3E, G3E, H3E, J3E or R3E. A non-voice emission is
limited to selective calling or tone-operated squelch tones to establish
or continue voice communications. See 95.181(g) and (h).

(b) [Pertains only to the Radio Control Radio Service.]

(c) [Pertains only to the Citizens Band Radio Service.]

(d) No GMRS or CB transmitter shall employ a digital modulation or
emission.

(e) No GMRS. CB or R/C transmitter shall transmit non-voice data.

Bummer... What we COULD do with digital... Damn Qualcomm.

Hmm, how short-sighted of you Hank. If you were careful, you could even
fit a linux installation in the 15Mb of flash the machine has. My packet
radio PC here only has 24mb of stuff; previously it had about 13mb so it
can be done if you cut it down enough. No mods required.

$99 for 32Mb of RAM, a 200MHz C6 CPU, built in modem, and
FLAT SCREEN DISPLAY is expensive? Fine, buy one and send it to me,
they won't ship outside the USA.

Nope, you were being a smartass, whether that was your intention or not.

Ham IP addresses are as available as they ever were. We've got
lots of them. More than 48,000 have been allocated in more than
150 countries worldwide. There are over 600 gateway systems routing
disjoint blocks (subnets) of the AMPRNet via IPIP tunnelling on the
Internet.

All volunteer, all non-profit, all with no fees or dues involved.

Regional coordinators have blocks of addresses from which to hand
out to any ham who wants an address (or more than one, within
reason), and none of those blocks are fully allocated.

(In fact, I only coordinate the block allocations, and except for
here in San Diego, I don't assign host addresses at all.)

Just ask the dude who handles it in your area. See list below.

Take a look at www.ampr.org for a little more detail.

Wow, what an open mind you have. Seems you cleaned off your glasses just a little.They'll probably know about as much HF as you did when you 1st got started. As far as when they "beep" you, perhaps they'll try beeping you 40 years after they have a license, much like you will try digital 40 years after you were licensed.

See you on the bands.

>> for their own amusement.

Did you know that you nearly can telephone every country in the world for
less money than it would cost to set up a DX-contest grade ham station?
How many DXpeditions carry INMARSAT or GlobalStar phones with them for
when they seriously need to communicate?

With the possible exception of 20 meters, the argument can be made
that we don't use enough of our ham bands to justify keeping them.

High-bandwidth NEEDS are one of the few ways we can justify all the
spectrum we have.

Making an emission so narrow that lots of them fit in a little space
is an extremely good way of ensuring that soon all we will have is a
little space.

I think we should experiment with bandwidth-sucking high-speed data
radio, digital voice radio, spread spectrum, complex modulations,
multicarrier, images, video, file sharing, all kinds of stuff.

Look forward, not back. Jet cars, not buggywhips.

I suspect they'd like to, but then, they can always ask the NSA to do
it for them. They're the government's signal intercepts experts.

It is my belief that a lot of that 'monitorability' is a leftover from
wartime, when (obviously) anyone who owned a radio transmitter could
easily be passing secrets to the enemy. Complex technical specifications,
in Morse code. And monkeys will fly out of...

>(To make it useful one must add a hard drive and make other modifications).

Well, to use it "as a TNC" or as a ham radio terminal in general, you
don't need the hard disk. Reading the page I notice that it not only
as a sound interface, but also a 16MB flash drive. This would be enough
for a Linux kernel, AX.25 utilities, and applications. Ok, including X
could be a bit difficult (though not impossible, there are Linux bootdisks
including X on 3 floppy disks or so), but character mode would be easy.

>reddish bronze color.

I think you're confusing the Chrysler turbine cars with the Batmobile. George
Barris did design the latter. It was a *fake* turbine car. The real Chrysler turbine
cars were modified Chrysler 300s. The only distinctive visual difference between
the turbine cars and a stock 300 was the large exhaust pipe. They made 50 of
them. I had the chance to drive one of them for an afternoon.

>The only real drawback I remember reading about was the temperature of the
>exhaust gasses. - Something we could more easily deal with now.

That wasn't the only drawback. The big drawback was turbine lag. You'd
step on the throttle, and 5 seconds later the car would respond after the
turbine spooled up. That'd get you killed in today's traffic. The second
drawback, not so important then, was the miserable fuel economy. They
got 2 to 3 MPG in city traffic. The third drawback was noise, the turbine
whine was quite loud when it spooled up. The fourth drawback, again
not an issue then, was NOx emissions due to the high turbine operating
temperature.

Most of those problems are fairly easily solved with today's technologies.
First, you'd use hybrid turbine/electric drive. That'd let the turbine stay
spooled up all the time which would eliminate the turbine lag, and would
allow the turbine to be tuned for best efficiency (which can be quite high
for a fixed speed turbine). You'd also use regeneration by preheating
the intake air with the exhaust using an air/air heat exchanger. This
would boost thermal efficiency, cool the exhaust, and quieten the car
as well. NOx is a tougher problem. A 3 way catalyst might handle it,
but the cat converter would have to be *huge* since the turbine pumps
an enormously greater amount of air than a comparable IC engine.

Of course if you included batteries, you could get by with a much smaller
turbine, since it would only have to supply average energy needs instead
of peak needs (briskly accelerating a car takes much more power than
sustaining it at cruise). You could also use regenerative braking to gain
some extra economy in stop and go city driving.

Hybrid cars make a lot of sense. Honda has a nice one that's being test
marketed now. It has the performance of the GM EV (which is surprisingly

good) without the serious drawback of very short range that all current EVs suffer. It uses a small IC engine instead of a turbine, but a turbine would work well in that setup too. (I believe there are current experimental hybrids that do use small fixed speed turbines, but I don't think any of them have reached the test market stage yet.)

>access provider?

Yes. Its firmware only works with a particular service provider who
charges $29 a month for their service (compared to the industry wide
average of $14 a month). But the hackers have found a way to run
Linux on it (or Windoze if you must), which frees you from that provider.
(You don't have to sign a service contract to buy the machine.) So you
can get a Linux box for $99 which has all the features of a multimedia
laptop in, as you say, a different case.

There's no hard drive, but you can add one since there's an IDE
controller inside, or you can just boot off of a flash PC card (it has
a PC card slot). This isn't a screamingly fast machine, but it is
plenty good enough to do packet or PSK31 using the on board
sound chipset. At $99 it is cheaper than a TNC too.

Do you know about the "extended sequence" option (modulo-128 numbering)
that I proposed some years ago? It has been implemented in a number of
environments, and solves these problems. Because it additionally limits
the MAXFRAME to half the sequence space, it even allows for buffering
out-of-sequence frames without ambiguity problems.

It can be found on my website.

You've probably heard me mention a time or two the Amateur Packet Radio network in Europe being much more advanced and developed than anything in the US?

Well, the CB operators over there are better off too. They CAN and DO use digital, and operate a CB BBS network similar to that used by Hams. It's legal over there.

Seems like I remember a George Barris - designed Chrysler turbine car in the late 60's-early 70's... The front of it looked like the rear of a '61 T-bird (also designed by George Barris) and a number of these cars were leased out to volunteer "beta testers". Every picture I ever saw of one had it in a reddish bronze color.

The only real drawback I remember reading about was the temperature of the exhaust gasses. - Something we could more easily deal with now.

Hey, guys and girls,

I know what let's do!

Let's pass the hat and buy dump huck Charles a big honkin' CB rig and a
train ticket to Europe and we'll be rid of his constant whining and
burping.

And that's the way it is!

Walter

For those of us that have been waiting for APRS for our Windows CE handheld PC's, the Beta version is out & working. You can download it at:

ftp://ftp.tapr.org/aprssig/wince/

I put it on my venerable old Casio Casiopiea A-10 (with 4MB memory, Windows CE 2.2, & 8 MB storage card). It works nice. The program itself has to go into regular memory storage but the maps can all go on the storage card. I just downloaded & did initial checks & it looks good. I'm still fiddling with it.

Good luck on your systems & 73's.

Well lets start with on amateur packet or any ham freqs you can't discuss anything business related. Nothing that can be business at all. So if I send a message to my friend that I work with and we talk about what we are going to do the next day or about a stupid customer that can't get logged on because they are using their password for their user name then we just broke the law. Chances of getting caught are slime to none but it is not legal. Packet on FRS would be great. We use it to talk about things all day long and it would be nice to be able to send messages that the casual listener would not get. Are the scramblers legal?

I think you would be OK. You can't use the Ham frequencies to promote
your business. Ie: you can't talk about how good your company is. But, you
can talk about stupid users and such.

-Matt

No, you can not conduct business on the amateur bands, but you can have the conversation you mentioned below and it would NOT be against FCC regs.

Yes, packet on FRS would be interesting, but it IS against FCC regs.

Cross-posted to: comp.speech.research,rec.audio.pro,rec.audio.tech,rec.radio.amateur.digital,rec.radio.amateur.digital.misc

Besser Associates is offering their acclaimed
DSP Made Simple for Engineers class in
Mountain View, CA on 18-20 April 2000.
This 3-day class is particularly well-suited to those involved
in RF and Audio signal processing, and computer programmers,
who need to learn the fundamentals of DSP. Details of this
course, including target audience, learning objectives, course
outline, materials descriptions, and past student comments
are appended to this posting as items "A" to "I".

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/ to view our public course
catalog and current schedule.

------detailed course information follows------

A. BESSER COURSE TITLE:
"DSP Made Simple"; a 3-day tutorial course on digital signal
processing (DSP).

B. TARGET AUDIENCE
* The primary audience is practicing RF (and Audio) hardware
Engineers and Technicians who need to understand digital
signal processing (DSP) because of its ever-increasing
role in the processing of real-world signals.

* While DSP Made Simple is not a "programming course", it is
particularly well suited for computer programmers because
of their increasing need to understand DSP algorithms.

* In general, this course is beneficial to anyone involved
in the acquisition, generation, transmission, manipulation,
or analysis of signals.

C. WHAT THE STUDENT GAINS FROM THE COURSE:
* The ability to apply DSP techniques to real-world
signal processing problems in their work.

* A solid grasp of DSP basics and the ability to move
gradually to more sophisticated DSP concepts and
applications.

* The ability to speak the language of DSP.

* The ability to understand written descriptions (articles,
application notes, textbooks) of DSP methods used
in practice.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/

D. COURSE OUTLINE

_____
DAY 1
DISCRETE SEQUENCES AND SYSTEMS
* Discrete Sequences, Their Notation, and Representation
* Signal Amplitude, Magnitude, Power Definitions
* Signal Processing Operational Symbols

PERIODIC SAMPLING
* Periodic Sampling and Aliasing
* Sampling Low-Pass Signals
* Sampling Bandpass Signals
* Spectral Inversion in Bandpass Sampling

THE DISCRETE FOURIER TRANSFORM
* Understanding the DFT Equation
* DFT Properties
* Shifting Theorem
* Inverse DFT
* DFT Leakage
* Use of Windows
* DFT Results Interpretation

_____
DAY 2
THE FAST FOURIER TRANSFORM
* Relationship of the FFT to the DFT
* Hints On Using FFTs With Real-World Signals
* FFT Input/Output Data Index Bit Reversal
* FFT Software Availability

FINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Finite Impulse Response Filters
* Convolution In FIR Filters
* FIR Filter Analysis and Design Examples
* Half-Band FIR Filters
* Phase Response of FIR Filters (Group Delay)

INFINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Infinite Impulse Response Filters
* The Laplace Transform
* The z-Transform
* IIR Filter Design and Analysis Methods
* Pitfalls in Building IIR Digital Filters
* Cascade and Parallel Combinations of Digital Filters

* Comparison of IIR and FIR Filters

_____
DAY 3
ADVANCED SAMPLING
* Quadrature Signals and Quadrature Sampling
* Quadrature Sampling With Digital Mixing
* Digital Resampling
* Decimation
* Interpolation
* Decimation and Interpolation in Combination

QUANTIZATION and A/D Converters
* Finite Word Length Effects
* A/D Converter Operation
* Effective Bits
* Improving A/D Performance
* A/D Converter References and Internet Sites

ADDITIONAL TOPICS (If We Have Time)
* Reconstructing a Continuous Signal
* D/A Converters
* Floating Point Number Formats
* Block Floating Point Number Format
* Matched Filters

E. WHAT THE COURSE DOES NOT COVER:
The DSP Made Simple Course does not cover the hardware architecture of commercial DSP integrated circuits. Likewise, while the course introduces the topic of commercially available DSP design software packages, no computer programming is performed as part of the course.

To register, please contact Besser Associates at 650-949-3300. For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/

F. COURSE HANDOUT MATERIAL
* The training material comprises 475 pages of class handouts. With the typical lecturer, the student must decide between taking notes, or paying attention to what the lecturer is saying. The training handout solves this "note-taking" dilemma. The DSP Made Simple training material provides a "bulletized" description of each DSP topic in addition to an abundance of diagrams. A textual description summarizing the key DSP concepts are included at the bottom of each handout page.

* The book "Understanding Digital Signal Processing", written by the instructor and published by Addison Wesley.
(This text is Amazon.com's top-selling DSP book.)

* Pertinent DSP documents, such as tutorial articles on DSP, lists of DSP-related Internet sites, vendor application notes, etc.

G. COURSE LECTURER:
RICHARD LYONS is a Consulting Systems Engineer, and lecturer with Besser Associates. He has been the Lead Hardware Engineer for many multi-million dollar signal processing systems for both the National Security Agency (NSA) and TRW Inc. An experienced lecturer, Richard has delivered signal processing seminars and training courses throughout the US and Europe. He has written numerous articles on DSP topics, and authored the course text "Understanding Digital Signal Processing". Richard is a member of the IEEE and Eta Kappa Nu, the electrical engineering honor society. The instructor can be reached at <riclyons@ix.netcom.com>.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/

H. WHAT'S GOOD ABOUT THE COURSE
* Instead of overwhelming the student with complex mathematics, the lecturer uses intuitive explanations and well-chosen examples to develop a fundamental understanding of DSP theory. (A recipe for technical material that's too rich in equations is hard for the beginner to digest.)

* The practical aspects of signal processing techniques are stressed as opposed to mathematically rigorous discussions of discrete system theory. THIS COURSE TEACHES THE STUDENTS HOW TO USE DSP IN THEIR WORK.

* Comprehensive in scope, and gentle in approach, the course gives the student a thorough grasp of the basics and the ability to move on to more sophisticated DSP concepts and applications.

* In addition to covering the key practical aspects of DSP, a collection of tricks-of-the-trade used by DSP professionals, to make their processing more efficient, are introduced throughout the course.

* In terms of DSP training, this course is the beginner's best opportunity to efficiently and thoroughly learn the fundamentals of DSP.

I. QUOTES FROM RECENT STUDENTS:

"Excellent course for engineers wanting to get (an) insight into DSP."
- George Hughes, Lockheed Martin

"This course takes the mystery out of DSP. Rick has a knack for presenting information in a way that is very logical and easy to understand."
- Dale Laing, Lockheed Martin

"Lyons presents a very solid engineering perspective of the subject with a minimal, yet sufficient, amount of math."
- Gene Kozin, Itron Inc.

"Lyons' is an excellent communicator of highly technical material. He uses plenty of real examples to translate theory to something of utility."
- David Day, Day Test and Measurement Inc.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/ to view our public course catalog and current schedule.

There was a good deal of discussion about these topics during the AX.25 V1
to AX.25 V2 transition also. This was mostly "pre usenet" though, and done
through various dialup threaded discussion servers, e.g. the one at NJIT.
As far as I know, this discussion was not archived. Perhaps someone else
knows different and could point us to an archive?

Is there still software in use that requires AX.25 V1? I'm thinking of tossing
out the code that handles it

Also in the 14th ARRL Digital Communications Conference procedings.

Seemed like a good idea when I first read it, and still looks good after
re-reading the article. Now that I have some stable AX.25 and NET/ROM
code running (in SNOS) perhaps it is time to implement Rob's ideas.

SNOS does not transmit FRMR, like most (or all) of the NOS variations.
It did for awhile, but seemed much simpler to do the "obvious" thing for
each of the error cases ... usually a link reset.

That's where I'm headed myself. Nonetheless, the obvious thing isn't always
all that obvious.

So far, I've only seen one node on the air around here that sends FRMRs,
a Ka-Node.

I'm under the restriction that I'm building a packet server that needs to
support what people bring, so alternative protocols really aren't an
option (though I'm not worried about V1 AX.25).

Try this URL for the top-of-the-line in HF modems. I've got a PTC2e and
it works much better than anything else I've ever had.

Common modes? You need to look in to grounding that.

>(You don't have to sign a service contract to buy the machine.) So you
>can get a Linux box for $99 which has all the features of a multimedia
>laptop in, as you say, a different case.

I had seen the page with the technical details, but not the service
provider page. Now I saw there is a link to it, and when I click
"purchase" it looks like the form has a radio-button to select the contract
payment interval with a minimum of 1 month, no option to buy it without
the service. It does not list a minimum contract period, as far as I have
seen.

But unfortunately it is USA-only... Internet access boxes do exist here,
but all the types I know of operate via a TV. (except the Apple iMAC :)

BTW, $14 a month is high-end access provider pricing here, the average
must be much lower... must be the effect of free local calls.

Circuit City is offering them for $99 with no contract. Of course
then they try to sign you to a contract since the box is useless
to the clueless without it.

Beats me but if you paid any serious attention to the dxpeditions
you'd find that in most cases all comms are done on the ham bands when
they're out in the deep boonies.
>
>With the possible exception of 20 meters, the argument can be made
>that we don't use enough of our ham bands to justify keeping them.
>
True on VHF/UHF but not on HF which I think is we're talking about
here. There are no visible threats to HF ham radio. The current drift
is toward expansion of the HF ham bands a la the three new 1979 WARC
bands and the low-profile work currently underway which is expected to
lead to a new ham band around 5Mhz. There is a distinct dividing line
at 30Mhz, what is good for the goose on VHF/UHF is not good for the
gander on HF wrt to threats and justification.
>
>High-bandwidth NEEDS are one of the few ways we can justify all the
>spectrum we have.
>
What are these "needs"? How many hams "need" high-bandwidths on HF vs.
how many do not "need" high-bandwidths and where is there any
indication that the FCC or any commercial or military interests are
threatening our HF space?
>
>I think we should experiment with bandwidth-sucking high-speed data
>radio, digital voice radio, spread spectrum, complex modulations,
>multicarrier, images, video, file sharing, all kinds of stuff.
>
>Look forward, not back. Jet cars, not buggywhips.
> - Brian
>

In the first place there would be no real "experimentation" involved. All any of these would essentially do is replace hardwired Internet connections with modems which feed radios which feed antennas instead of feeding twisted pairs or coax cables or fiber optics transmission/reception media. This general category of technologies already exists in profusion, much of it could go on the air very shortly if it was permitted so there's no technological lightning or magic or "advancing the state of the art" in any of it.
>
The big problem of course being that none of it would be RADIO, the radio would obviously become incidental to the objectives you list above, radio would just be another modem mode.
>
A bit of simple freshman math will clearly indicate that even if the entire ham HF spectrum were to be turned over to wideband digital modes the collected sum bandwidth would be miniscule compared with, for instance, the bandwidth avaialble on the upcoming light pipes.
>
I strongly urge you and others with similar bents start making noises at the FCC to allocate, say, 2Ghz of unrestricted amateur operating space on the light band so that you can do your wide things. It's just another bandwidth resource like HF radio except 'way better, right? Why not? Plus there's no QSB, no Riley, no code tests and it's open 24/365 and the baud rate would be mind-bogg;ing, just what you're looking for, how sweet can it get? There's your jet car.
>
As far as jet cars go I rode in one of the fleet of demo pink & gray 1956 Plymouth Belvedere turbine-powered "family jet cars". Which were one of most memorable flops ever to come out of Detroit and nobody has been stupid enough to try that crap again.

It wasn't a flop, it was a concept car. I think the first ones were produced in 1953 or 1954. There was no way it was going to compete with gasoline at 25 cents a gallon, although kerosene was a big seller at gas stations even in *my* youth, but disappeared in the late 60's.

What the real flop was, is the pollution we all endure now. I remember when the sky was blue, and you could see stars at night. You have to go to North Dakota to see that now. Plus, we wouldn't have had all those muscle-cars and SUV's to consume Iraqi oil at 3 MPG, and lead poison the lakes... So maybe it's a good thing turbines were never marketed (or flopped as you say).

Right. A lot of military pilots who had high times in prop ships in
WW2 died in the early jets because they were used to the instantaneous

power they could suck out of their Allisons and P&Ws when they
firewalled the thottle in jams. Not so with the J-47s and such which
as you point out took 5 or so seconds to spool up and provide the
juice. Late don't cut it unless you really think ahead.
>

Gas turbines are ONLY even remotely efficient when operated within
close tolerances to their design speed. Gotta be used in a
constant-speed system or forget it.
>
The big problem with gas turbines is rooted in the basic physics of
their thermodynamic cycles and the lack of materials which they need
to withstand the temps which would then make them more competitive.
They're dismally poor wrt to specific fuel consumption so far vs.
archaic recip engines (ignoring Wankels) of the same power output. But
if the fuel bill is simply passed on to the fares you can't beat GTs
when the more important need is the most power in the smallest
lightest package. Which is howcum 747 jocks fly with GTs and most of
us plod around in far more fuel efficient cast iron 1800's Otto cycle
dinosaurs. Kinda reminds me of the discussions about cw. But I'll
pass. This time.
>
> You'd also use regeneration by preheating

>some extra economy in stop and go city driving.
>
That has proven to be sticky because the kinetic energy of a vehicle
is low in city driving, mv^^2, etc. so there's not much energy to
recover. Turnpikes decels are another story.

>
A lot of hybrids have been developed and tested including, for
instance, IC and turbine engine and battery/flyweel stored energy
hybrids. Most of which are based on electric motor final drives which
is very good.
>
On a weight/space basis flyweels can store more energy than any other
energy storage method. But flywheels bring their own bags of worms to
the game like the need to run in a vacuum, safety and cost. It's a big
matrix of possibilities and the quest continues.

By definition, HF's upper bound is 30 MHz, so no, you can't do
HF contesting above 30 MHz.

As communicators first and foremost, do you believe it's a sound idea
to have all the world's HF-amateurs proficient in a common mode? If so,
which is currently more common -- Morse/CW or digital?

Second that. The PTC controllers seem to be the best available
at this time, and there is good software available for them.

G8BPQ will send FRMRs.

Sure don't see them very often. In fact have not seen one on any of my
6 links this Millenium (smile). Added diagnostic code to log them when
I was playing with supporting FRMR, but had to intentionally introduce
errors before I could trigger any. That convinced me that FRMR handling
should occupy VERY little code, and that I should not bother to send them.

Have been considering a "node unbroadcast" extension to NET/ROM.
i.e. if a link was "really lost", notify adjacent nodes of that fact right
away.
Also when a new link is discovered, do an immediate broadcast of
that new link. The "node unbroadcast" would be a simple addition to
the protocol using a unique tag (say 0xfe) in place of the 0xff BC ID.
An alternate technique would be to use a different PID ...

Most of (all of?) the NOS ip-over-NET/ROM implementations use the
NET/ROM equivalent of UI frames. This has the potentially adverse affect
of bypassing NET/ROM's end-to-end flow control, and can in fact cause
serious congestion problems if timing parameters are not carefully adjusted.
K-net seems particularly prone to this problem, at least in version 1.0.

Are there ip-over-NET/ROM implementations that use NET/ROM
connections instead of simply tossing L3 frames for NET/ROM to route?

As a communicator, I don't believe it is at all
a sound idea that we have all the world's HF
amateurs proficient in any single mode. It might
be a wishful thinking goal, but by example we already
know that it just isn't the case. The limitations to any
mode being viewed as a common mode are not as
simplistic as simply having the equipment and or skill
to do morse code (or digital).

IF and ONLY IF, the requirements for HF licensed
hams mandated retesting of a particular mode,
mandated knowledge and fluency in a
common language (e.g. English, Spanish or whatever)
and demanded the ham have that equipment
in his/her shack, then and only then would
you have a truly common mode capability among all
the world's HF hams.

Cheers,
Bill K2UNK

What exactly would the purpose of such a common mode be ?

There is already a common mode known as Carrier Detect Multiple Access
(i.e. listen before transmit) to coordinate the use of the shared
frequency resources :-).

How do you expect anything more subtle than this frequency access
protocol to be enforceable, when some rude operators ignore even this
simple principle (usually with big linear amplifiers) ?

When you only want to support incoming connections, there is no worry at
all with the extended sequencing, because negotiation is completely
automatic and initiated by the transmission of SABME instead of SABM.

Only when you want to make an outgoing connection, you need to consider
if you want to send SABME and risking confusion at the other end.

In this case the PK-232 is the level converter. The manual was
talking about the Electronic level converter in place of a polar
relay.

Connect up FSK-N as AEA considered Icom to be normal for FSK service.

Get yer head outta yer ass once again Burke, when/where did you ever
see me post any such sentiment?? I don't care if they beep, yak or
warble as long as they don't screw up the bands with wide modes which
infringe on the users of other modes. How 'bout we somehow determine
the total number of users of all modes in the 20m band and divide that
nunber into the 350Khz we have available on 20m in this country and
come up with the allowable bandwidth for all modes, fairness being
fairness and all that.

FYI, we've tested the Entega and Belkin USB to serial converters with all the major TNCs (Kantronics, AEA/Timewave, MFJ, HAL and SCS) and have ran into no problems except on older computers where USB support was in the early design stages.

I've also heard 'rumors' of a TNC with a built USB port on the way... but can't say much about that. ;)

Why is it, that every CW fanatic descends on this group whenever a
modern form of communication is experimented with?

The fact is, that after April 15th, CW is effectively dead as a political
tool. Get over it.

>>I understand that the $99 price only applies if you sign up for the
>>service. It's $199 otherwise.

It's $99 with or without contract. If you use the 800-number to order,
(which is the only way if your Circuit City is out) then you will be
automatically signed up for the service upon signing for the package.

This is not a contract, however, and can be cancelled any time. I am
just going to play with it for the first month while I'm getting together
my game plan for modification, and then I'm going to cancel.

Rumor is that they didn't require this as recently as last week, but,
I guess I can understand where they are coming from on this one.

Why is it, that every geek who advocates what he considers to be a "modern form of communication" feels obligated to make disparaging remarks about CW operators? Will the CW sigs somehow keep the newer stuff from working? What's the excuse for the unreasoning hostlity? Hmmmm?

CW ops do not "descend on this group", but they will defend themselves when someone goes out of their way to run them down. Unreasonable of those mean old CW ops to defend themselves, isn't it Steve?

>
> The fact is, that after April 15th, CW is effectively dead as a political

Fact is, CW never was big as a "political tool". If this is your take on what hams do with CW, no wonder you are so clueless and hostile about the mode.

...But then again, Steve, you have always shown a penchant for displaying clueless hostility to your fellow Hams and to be fair, your unreasoning hostility and deep-rooted ignorance has been directed at almost ALL legitimate Hams and Ham activities discussed on this news group; Not just morse code.

RV, then why didn't you say, "When I see some of these upcoming 5wpm
digigeek Generals ***beep, braaaap, or diddle*** anybody I'll have more
respect for what they
actually know about HF ham radio."

No, you said beep. That means Morse/CW, no?

```
For anyone who is interested in
restoring/collecting/operating military radio equipment,
there are two radio nets on the U.S. West Coast if you
are in that area:
---------------------------------------------------------------------
The armyradios mailing list discussion group net:
Saturdays 10:00 AM, Pacific Time on 7296 KHz, Upper Sideband
( http://www.onelist.com/community/armyradios> )
Note also that the armyradios mailing list has about 212 subscribers
and are scattered throughout the U.S. and Europe, along with some
members in Asia and Australia..

Further info on the armyradios mailing list can also be found on the
following website: <http://www.tactical-link.com>
---------------------------------------------------------------------
The Military Radio Collector's Group Net:
Saturdays 9:30 PM, Pacific time on 3980 KHz, AM or SSB

Thanx

Trish

>An alternate technique would be to use a different PID ...

Many NET/ROM implementations have had this for years. They use a broadcast
with quality 0 or 1 for this.
Tag FE is in wide use as a "request broadcast" indicator. When a node
starts, it sends its first (usually empty) broadcast with FE tag and
expects the neighbors to send their broadcast as a result, to quickly
fill the routing tables after a restart.
This is supported by NOS, TheNET, pe1chl-NET and others.

>Most of (all of?) the NOS ip-over-NET/ROM implementations use the

>of bypassing NET/ROM's end-to-end flow control, and can in fact cause
>serious congestion problems if timing parameters are not carefully adjusted.
>K-net seems particularly prone to this problem, at least in version 1.0.

NET/ROM implementations need to have a "discard" type flow control whereby
they use soft and hard limits on the outgoing queue lengths. Above a
certain soft limit they can return congestion indications for connected
mode packets and should drop connectionless packets. Above the hard limit
they should discard everything.

pe1chl-NET has this, but most likely other NET/ROM implementations don't.

Stupid TCP options like "no backoff" or "linear backoff" have been built
into some versions of NOS. This is lethal in any network environment
where hop-to-hop retries exist.

>Are there ip-over-NET/ROM implementations that use NET/ROM
>connections instead of simply tossing L3 frames for NET/ROM to route?

There exists a German hack to send IP frames in normal pid-F0 packets.
It relies on packets being correctly re-assembled in the presence of
network level fragmentation. To assure this, the effective packet length
must be set very small, making it a very ineffective protocol.
(I think they recommend 88 byte MSS to have packets <= 128 bytes)

Admirable!! Now go do it. Whenever you have a product that does any of this, give me a call.
Morse is itself quite digital except that it can be decoded by a trained/practiced human brain under conditions that machines cannot (as yet) handle. SSB is phone cut down to the bare essentials and is also readable under conditions that defeat machines. So far, the physics and bottom line are with traditional modes. Where else can you find a servomechanism that can do so much, be produced by unskilled labor, and feeds itself?

When you arrive at a method that is not just another AFSK device however neato and get up the urge to divorce it from SSB transceivers, call me. Being in fact a digital mode, avid CW ops will be there because a lot of the limitations of SSB transceivers affect CW as well but we are used to working around them. When you get the digital version of QSK and you can lock on your filters inside of 30 minutes, call me. If nothing else, the ditty-boppers will provide you with a market that might interest a manufacturer. Experiment away, I did with slow-scan and even ran FSK in the days. At the present state of the art, digital fax (really what slow scan is) makes one hell of a lot more sense than digital voice.

No one is dumping on digital as such. What needs to happen is some small and immature minds to get beyond "Code Old, Bad. Digital New, Good" when the reality is that they don't understand either one.

Political, in the sense that the ARRL destroyed Ham radio by delaying the
No-Code license, and impeded everything with a call to arms of its CW
membership ranks. They destroyed Ham radio by slicing up the bands
into a CW class system that only a Hindu could appreciate. It wasn't the
FCC that wrote the rules, it was the ARRL that forced the incentive
licensing "Hindu" class system.

That system (politically motivated) is over.

Have never seen this. Is it immediate, or does it wait for the next
node broadcast? I had in mind something "realtime". Played with it
a bit and it seemed useful, at least in networks where nodes come
and go frequently, for example users that turn off their computers,
but still need NET/ROM connectivity to be able to route ip.

I like the "idea" of immediate passing of heard node broadcasts,
but there is a large hazard of creating broadcast storms this way.

> Tag FE is in wide use as a "request broadcast" indicator. When a node

Am aware of this one. Did not become convinced it was useful,
since the only time it made sense was the very first time a node
came on air. After that first startup of a new node, it should be
able to keep track of it's own node list and not require bootstrap
of the node list on reboot. Once watched JNOS in a reboot loop
cause continuous node broadcasts from three adjacent nodes.

Right now watching K-net drop two of every four ip packets presented.
Every time, without fail. It's not running out of buffers. Just drops 'em.
Will pass six frames in connected mode, but only two at a time unconnected.

> pe1chl-NET has this, but most likely other NET/ROM implementations don't.

Yes, something to be avoided at all cost! Can bring a NET/ROM network
down in short order. Perhaps this is one reason tcp/ip has such a bad
reputation in some areas (smile).

Not so good. I may play with some ip-over-nr that uses NET/ROM
connections to see how well that works. i.e. encapsulate in pid-CF frames.

Appreciate your comments on all this!

You were running packet cluster, merely an extension of your HF hobby. If you had not, you wouldn't be even close to being competetive in the HF DX circles. Today, internet spotting has pretty much replaced packet cluster. But of course you know that since u used to be on packet *eons* ago.

16. Internationale Packet-Radio-Tagung / 16th international PR-convention

```
*******************************************
* *
* 16. international PR-convention *
* April 1st and 2nd, 2000 *
* *
*******************************************
```

Dear XYLs, YL and OMs,

Like the past years, the conventions' purpose is to enable all participants
to exchange current information about the future development of our communications
mode and our packet radio network in particular, in lectures, workshops and
presentations.

The event is organized by:

- DARC District of Hessen (Technical-Group)
- Rhein-Main-Packet-Radio Group (RMPRG)
- Arbeitsgemeinschaft der Funkamateure der TH Darmstadt (AFTHD)

The convention will take place on

=====> April 1st and 2nd, 2000 <======

at the Hans-Busch-Institute of the Technical University of Darmstadt (TUD), Germany.

Additional information is placed at
http://www.afthd.tu-darmstadt.de/darmstadt-2000/index.html .

Program

Some of the conventions' highlights are:

- Thomas Sailer, HB9JNX is giving lectures about
- his new USB-Modem concept (for Linux?),
- further development of the soundmodem-project and
- a very interesting new variant of generating FSK modulated RF
signals digital using a modified PLL-synthesizer aproach.

- Gunter Jost, DK7WJ will inform about the internal design of
PC/Flexnet32 and Flexnet for Windows NT and 2000

- Jens David, DG1KJD will speak about his new PCI-based highspeed
4-channel SCC-card and the further development of DG2FEF's approach for
a new Linux AX.25-Kernel

- Udo Tillmann, DJ5UO from TEMIC Semiconductors presents a lecture about bluetooth, the new short distace wireless communication system.

- Hans-Peter Zorn DG4IAD and Jochen Sarrazin, DG6VJ will present new ideas about the "PR-Program"-area,
- DIDADIT, a new protocol to transmit binary files and
- a new convers protokoll.
You will be able to see both implemented in the latest version of the linux-based, graphical PR-terminal "LinKt".

- Again Ekki Pflicht, DF4OR will present his beginner lectures
- the AX.25 protocol,
- how does a digipeater work,
- what do I need in order to use PR at home etc.)
Furthermore he will read a paper about his new program "DigiMap".
It's able to create link maps automatically.

- Ulf, DG1FAZ and Gerald, DL9FCK will present their new 32bit-windows based PR-terminal "Paxon".

As usual the lead-in lecture will be held by a professor in ordinary of the Darmstadt Technical University.
This year Prof. Dr. Ralf Steinmetz is speaking about the future of internet.

Additionally there will be some workshops this year.
At the moment following are planned:

- Linux workshop
- installation and usage of PR under Linux with a modern AX.25-Kernel
- KDE and LinKt, the Linux/KDE PR terminal.
Please bring your computers along with you.
Our goal is to provide everybody with a usable PR system running under Linux and basic understanding how the system is working.
The workshop will be led by Hans-Peter DG4IAD, Jochen DG6VJ and Jens DG1KJD.

- Paging workshop (Short-Amateur-Messaging-System [SAMS])
Holger, DB6KH will lead a pocsag workshop and present a new RMNC plugin-card. We will distribute more information ASAP.

- 9600 Baud fsk workshop
Andreas, DL2FZN will lead a 9600 baud workshop.
He will help you to understand how the system works.
Also he will help you in analyzing the radio you will take along in order to find out whether it can be used or modified for 9600Bd or not.
We will provide further information ASAP.

On the second floor there will again be a small exhibition with a fast PR connection. If you want to present something you can use our inhouse LAN to get access to our local network nodes DB0FLX and DB0DAR.

Fritz, DG1DS will open his link coordination booth.

We are still not yet sure if Siggi, DF5AA & Co will visit us with their great radio test facilities.

Henning, DF9IC will moderate a discussion about "Telemetry and
ARPS data in the packet radio network".

Time schedules will be nailed down next week.

How to reach us

By car:

When driving on highway A5 or A67 use the exit "DARMSTADT/STADTMITTE",
drive straight into the city, ("Rheinstrasse"). Drive straight into the
CITY TUNNEL. Use the LEFT exit, at the following traffic lights go
LEFT, after this go RIGHT (into "LANDGRAF-GEORG-STR."), still heading
direction ASCHAFFENBURG,DIEBURG (B26). After about 300m you will see
Hans-Busch-Institute on the LEFT side of the street, Merckstr. 2 .

By Bus/Train:

Arriving at DARMSTADT-main-station use Bus "D" (direction "Ostbahnhof").
Leave the bus at bus-stop "TEICHHAUS-STRASSE"; after 20m downtown (back)
you will see HANS-BUSCH-INSTITUTE at the right side of the street.

======> GUIDE ON 145.375 MHz FM <=======

We are standby starting at around 8.30 Uhr on saturday. If you get lost
just call in.

Night Quartiers

If you want to stay at Darmstadt from saturday to sunday, there is a
limited quantities of quartiers available at the Universities' sport mansion;
just contact Alex, DL8AAU ASAP

E-Mail: a.kurpiers@uet.tu-darmstadt.de
Tel.: +49-(0)6151-16-2369

Of course you can also spend the night in a hotel or at the nearby youth hostel.

On saturday evening we meet at

Restaurant BAYRISCHER HOF
Alexanderstr. 33
64283 Darmstadt
Tel.: 06151/24550

It's a 5 minutes walk from the convention.

Scriptum

The scriptum is availabe at the convention. As every year, unsold scripts
will be given to ADACOM in order to sell them at exhibitions and other
conventions.

Unfortunately there's nobody yet who volunteered to accept orders
and mail them. If there is any change, we will let you know.

vy 73 de Jens, DG1KJD

You may have a point. The reflex arc has gotten shortened by those who feel called upon to pronounce CW dead (CW *testing* is dead and good riddance to that) for no better reason than they chose not to participate. Being an old football coach I tended to get a little testy when some soccer yuppie felt called upon to tell me how soccer was less 'violent', neglecting the fact that hi school soccer has about 2.5 times the injury rate. Confusing the rumblings of one's guts with the immutable rules of the universe (Heinlein) is not to me the mark of a man I wish to buy a beer. Besides, I played soccer which is a bit more than the judgmental yuppie accomplished. Fans give me gas; participate or shut up. So yeah, I may well be shooting a tad early in this target-rich environment.

Somehow I doubt it though.

I would like to have it explained to me, however, in either the football-soccer or the CW-digital contexts, just why the new sport or mode feels called upon to react to the older one with all of the frenzy of Dracula to a garlicwood cross. Or, in fairness why the old one with a track record and nothing to prove gets lathered about the new one. In the Morse-digital hooferah they are natural allies; it is on the phone bands that the going will get rough. So forgive me if I tend to see some hidden agendas here, the most obvious being a desire to suppress that which makes one feel inadequate (it sure keeps Larry in funny ha-has). If you think about it, that is our buddy KA Strom's motivation. Competition is one thing, warfare is another, but ethnic cleansing is taking things just a tad too far.

I guess the short answer is I will quit assuming a lack of understanding when I see some evidence of understanding -- or initiative -- or ambition. I'll even settle for someone defining himself as what he is rather than what he is not.

I'll try not to flaunt Extratude (that is truly stupeed) but I'll be damned if I intend to apologize for it.

Dick McCollum N0BK DOB 4 Dec 43, hardly a retired old fart.

First licensed Nov 1954, now N0BK. Been there Jane.

First I get Brian telling me my Extraness is showing, now it's get a
license.

Haven't had an event like this since the NRA and ACLU sent me mail on the
same day inviting me to contribute to saving the Constitution.

I think I will take a pass on this one. Perhaps another day after I have
savored this one :)
Like the Constitution, it will have to survive without me.

That wouldn't do it either, Mark. As long as there exist different languages, there will be no common mode. All the letters, abbreviations, and prosigns used with CW can just as easily be used with digital modes and/or voice modes. The fact is that two people who speak completely different languages just cannot communicate to a reasonable degree. (Call, name, RST, and QTH is NOT a reasonable degree of communication.)

There you go again...

Just like Sam Donaldson, you have no clue how to talk to normal people.
Does your wife even listen to you anymore? The kids? Do they just roll
their eyes when you enter into a conversation?

"soccer yuppies"?? What the hell is that? Are we supposed to choose sides
now, and chear with you on American football, and rail against European
football?

> I guess the short answer is I will quit assuming a lack of understanding
> when I see some evidence of understanding

I'm rolling, stop! stop! my side are hurting. Heeee boy--You're a natural!

Take your medication Grandpa. You played too long without a helmet.

For what it is worth, I like a good soccer game and know how to watch one. Played decently it is, as Pele said, a beautiful game. The assumption that there has to be a conflict is not mine but rather some ill-informed FAN who feels called upon to hold up a finger and bellow "We're Number One" as if in some manner this made him the equal of the player.

I maintain a social life, get laid regularly (my wife is no longer with us), see my friends and in general lead a fairly usual life. It is medication free beyond a daily aspirin. By and large, I don't regret a hell of a lot. As Kipling said, I've taken me fun where I found it.

I do not suffer fools, stupidity, or phonies well - if this be a character flaw, so be it. Ignorance is the state of the human race, me most certainly; you have something to teach I will be in your class. Please leave the status games at home. I think Sam Donaldson can take care of himself; he would most certainly have the good sense to check his sources,

particularly QRZ.com, before the 'come back when you have a license' crack. I won't touch what you think is normal.

If you feel taller standing on someone else's neck, just be sure it isn't mine. As I tried to get thru to my middle school players, trash talk is cheap -- at some point you have to stand and deliver.

Have a very pleasant weekend, steve, I have a date. Byeee.

Rick accurately portrays my position with the exception that I run ham stuff exclusively under Windows 98 and have not tried his package because I am sufficiently happy with XPWare that I do not choose to go through the pain of adopting a new solution - his PKTerm may be wonderful - but XPWare does all I want with consistency.

Been there and done it long before I landed in RRAP with these HF ham
radio digital wonks. This is like a class reunion for me.
>
>I am not defending CW as such nor dumping on digital. CW, like Notre Dame
>Cathedral, does not need my recognition or appreciation nor does digital
>need my approval.
>
Agreed. Except that I'm a hardass pragmatist, I can't get particularly
"philosopjical" about cw, the stuff simply works better than all the
other modes for dxing today and that's why I use it. When I'm not
dxing I'm up on the machines yakking with my nocode buddies. If there
were 300+ dxcc countries running PSK31 or Pactor2 I'd be running
those. There aren't, not even close, so I don't.
>
> My only real criticism of the digital talk-shop (other
>than being a talk-shop) is that they have not asked nearly a big enough
>question nor have they defined what and where digital modes can make a
>contribution.
>
That's my squawk on these guys. The way I see it they're trying to
sell something different just because it's different. That won't fly,

there has to be an advantage buried somewhere in the rationale for
"developing" it, "where's the beef?"
>
Beyond that what really pisses me off is that some of them expect that
the rest of us should cheerfully move over while they suck up wide
bandwidths just so that they can play.

>already has in some coding systems) where one could listen, QSO, or in this
>case provide a place for storage and relay of scanned copy as something of a
>slave unit has to be part of it. That is BTW why I like fax.
>
Correct. Except in the extremely rare case of the originating station
being stuck with nothing but cw the much better method would be one
which can store the info on a drive and print it. FAXES would work.
Plus FAX is the only established comms technology which supports the
swapping of images like pencil sketches and handwriting. Which
definitely has attractions in emergency comms.
>
> Net control

>the networking protocols when it has to be a network but allow me to be an
>op the other times.
>
Absolutely gotta have flexibilty and options in emergencies. Or, hell,
in any situation for that matter. That's why by definition hams are
radio operators and the public safety spectrum users are radio users,
not operators.
>

>
Very nice. Brain fodder galore.

>
I've very recently indroduced myself to the joys of synchronous
detection. I glomed a new-wave JRC-545 DSP general coverage rcvr some
months ago with which I've tuned the SWL bands, particularly the
overcrowded 11mHz BC band. The radio has a number of detector options.
I cranked in one of the sync detectors and it wuz suddenly like a
magic radio. I could pull 100% copy up out of weak sigs which were
absolutely inaudible because of QRM from bigger adjacent sigs when I
tuned with the conventional detectors. And that's with straight-up old
AM, monster carriers and all (the notch filter is awesome, it's like a
Pit Bull, it stays locked on the carrier no matter where you qsy the
radio!). So yeah, get rid of the carriers and run the FAX code thru an
ssb xcvr with a good DSP sync detector so you can shoot the output to
your screen, hard drive and printer and methinks there might be a gem
here.
>
>To summarize: define a decent vision and compromise your way back to

>Make any sense, Brian?
>
Absolutely it does. Looks to me like the only real hardware issue is
having DSP ssb xcvrs with good sync detectors, the rest would be a
piece of cake. The peripherals would simply be a laptop, a scanner and
a printer. No-brainers.
>
AND it's all existing technology which need to be milked. It oughta

Source record: 13503

I don't have an HF rig right now (drat and double drat) but was listening to 13 meter short-wave (right next to the 15 meter ham band) and was hearing stuff from Ecuador at about 05:30 GMT this morning here in Chicago. Were the bands that wide open? I listened to 10 meters and didn't hear a thing, though.

i put together couple of modems based on baycom 1200bps fsk
with tmc3105 chips. Willing to sell this, but i dont know if they're still
in use and how much they go for.

OK Jeff, here's a test for you. Please say, "The United States landed
a man on the moon in 1969" in CW so that a ham who doesn't understand
a word of English can understand the meaning.

> 73, Dick W0EX

Good to hear you again, Dick. Now I will have to go back to being Dick BK
again.

The heart of the issue is the cult of the FAN, this insane idea that
groupies are somewhere on the same plane as the people doing it, and that
one gains status by 'being a part of it'. Appearance is everything merely
leads to Mike Royko's famous '$200 haircuts on $1.98 heads'.

That wouldn't be so bad if the groupies didn't feel called upon to achieve
this mythical 'status' by first tearing down all that had gone before -
often as in this case pissing off the people who should be your natural
allies. Not to say that at some point the better product will not
exterminate the old - Sideband did a great job of ending the reign of
Ancient Mary.

The current issue is machine-to-machine communication on hf. Two issues,
really. Machines communicating is nothing new, Edison got his start with a
stock ticker. Where the operation becomes mechanical, use mechanics whether
it is a stock ticker or a telephone switchboard. If you plan to replace the
human operator, replace him and be done with it. At the very least, use the
machines to increase his productivity - rather than copy CW he can hang tape
on a Model 28. We have machines available called compooters so use them
already! The other issue is the unique aspects of doing it on amateur hf;
the village idiot can do it with a clear channel. So the CW ops developed
QSK and a sense of speed and bandwidth management methods that by and large
works -- now get your machine to do that. I have personally never used an
i.f. bandwidth less than the SSB filter's 2.5 kHz; like Ten-tec I do it with
homebrew audio processing about which articles abound; faking out one's own

mind with synthetic stereo is permissible if one has a mind to fake out. This particular bionic servomechanism does not like the 800hz tone that narrow filters dictate so I do my own thing.

The whole point is that human CW and machine communication in the flavor of the week are not mutually incompatible but are decidedly different approaches. To get into the sort of idiotic pissing contests that we have seen is a nothing more than an attack by groupies bellowing 'We're Number One'. There can be no dialog with a nincompoop -- there is no issue to discuss and he doesn't get it anyway. So he don't like CW -- big deal.

OK, how about:

Lower class
Middle Class
Upper Class

What do we use to distinguish each class?

Steverino, it's like this. I am not stupid, I am not inexperienced, it is not my purpose in life to entertain you nor preserve your slender sense of self-worth. I am your superior in virtually every way known to man, a fact for which I owe you neither apology nor consideration. I don't hate you, you are not worth having as an enemy. I also have no particular interest your opinions on much of anything. Do I make myself clear or do I have to dumb it down some more to 'talk to normal people'.

Broadcast engineers at radio transmitter sites are "radio operators" who
are not communicators, while we're actually in the intersection of the
two catagories.

Our boss, the FCC, even views us as communicators:

97.1 Basis and purpose.
The rules and regulations in this Part are designed to provide an amateur
radio service having a fundamental purpose as expressed in the following
principles:
(a) Recognition and enhancement of the value of the amateur service to the
public as a voluntary noncommercial communication service, particularly with
^^^^^^^^^^^^^^^^^^^^

The title of our national organization even reflects our image as
communicators: American Radio RELAY League; relaying communications
traffic was, in the beginning, our primary mission -- it remains
important to this day.

I'd like to bring everyone up to date on my follow ups with users of the newsgroup with this subject.

I've written emails to the four people that has responded to Gene's request to find out why they recommended XPWare or PkTerm. First, I'd like to thank both Jim and Roger for responding and clarifying that they weren't recommending it OVER PKterm, but just recommending it since they have never used PKterm and just liked XPWin..

Also, as I've written here before, when it comes to Windows 3.x based software,. XPWare is the way to go. PKTerm and Pacterm 98 are 32 bit software programs that don't run under Windows 3.x.

As for the other two emails, one bounced because of a fake email address and the other never responded publicly or privately to line he wrote that said PkTerm = buggy. If I don't get information about issues, I can only assume they never existed, or it was because of the lack of knowledge of how proper Windows based software works.

CSS is dedicated to making the best ham radio software at a fair price. The only way to do this is to get the input of everyone we can, on how to continually improve the product. And I thank every one who has done this so far.. your input is so valuable to us.

Brian

I loved your line, Mr. Kelly -- good physics and (correct me here) an attractive bottom line. I am not an engineer although one tends to develop the mentality. When faced with a major data-manipulation task I tended to make myself mildly unpopular with the usual VP/AVP brigade by asking such questions as 'what will you know when I am done and what do you plan to do with it?' Close if not identical.

I am not defending CW as such nor dumping on digital. CW, like Notre Dame Cathedral, does not need my recognition or appreciation nor does digital need my approval. My only real criticism of the digital talk-shop (other than being a talk-shop) is that they have not asked nearly a big enough question nor have they defined what and where digital modes can make a contribution. This comes dangerously close to asking why we need an amateur service at all so perhaps one can understand the reticence but at some point it has to do something different to make the game worth the candle.

As a start, envision how the Guatamala earthquake was handled. Health and Welfare traffic was flown into New Orleans and handled by the National Traffic System. The NTS may not be with us much longer and handling this sort of thing by SSB would be a fire drill of major proportions; digital phone would simply make it worse. An intelligent system (i.e. like digital already has in some coding systems) where one could listen, QSO, or in this case provide a place for storage and relay of scanned copy as something of a slave unit has to be part of it. That is BTW why I like fax. Net control has one for Omaha, I push a button with my NTS poop in memory, net control shoots it to me, and I do my thing. A kind of ad hoc internet. OK, design the networking protocols when it has to be a network but allow me to be an op the other times. Rock back in your easy chair and draw a mental picture of how some previous disasters would have been handled with this tool. The picture of the heroic ham hanging by his belt from a tree in a flood is a crock to begin with; emergency communication by digital means will be more like doing H&W for the Red Cross than anything else. Make a distinction between the front-line battles and the routine logistical support that is required.

There is no good reason why the same compooter (and let's assume a decent one, OK?) that is the dumb terminal/recorder on the end of the wonderous modem should not control the whole shebang including the frequency of my transmitter(s) and receiver(s). One for the control jocks. While we are at it, if we are going to do it right, adjusting transmission speed to conditions, asking for fill, and all the wonderment that that servo called Dick N0BK does routinely on CW, could be accomplished; here is one the AI

guys, fuzzy logic gentlemen, and assorted lovers of the arcane could have one good time doing. Make my compooter the control panel of my digital station. Give me the longest plug and play octopus in creation.

It is perhaps not the dumbest idea in history to begin by squirting stuff thru an SSB transceiver. Limiting oneself to it is surrendering before the battle, however. If I do not require a control panel at all on my equipment, doesn't this open up a whole host of possibilities? Would you do digital this way given a clean sheet of paper? Doubt it. Yes, a lot of a receiver is not mode dependent but some of it is; certainly one would use different audio criteria and quite possibly different detection and passband management techniques. Similar arguments apply to the transmit side. Modular rigs anyone??

Now comes the cute part. Given that SSB is by its nature a brute-force analog technique, at least the suspicion has to occur that it may not be the way to do it. I mentioned an old GE DSB system from the 50s which used synchronous detection to allow 6kHz signals to be spaced at 2 khz. This has reappeared like Banqo's ghost with some attempts to sneak it into spaces between FM on business band freqs. It would appear that neither DSB nor synchronous detection has been a stunning success but the concept actually makes a lot more sense with digital than analog signals. I would not bet on it myself but it is a question that needs asking.

To summarize: define a decent vision and compromise your way back to reality. If you don't the whole thing is one giant auto-erotic exercise. If you are going to replace modes built with the human operator in mind, be prepared to replace the human operator and all that is designed around him. Transmitting a human voice is the easy part; doing it in poor conditions is where the ingenuity comes in. You stand more of a fighting chance with fax or slow scan IMO. Don't be afraid to fool with the equipment -- and while you are at it, make your digital gear reasonably CW compatible and it might provide the economics to get the project off the ground.

Make any sense, Brian?

Steve, "this group" is rec.radio.amateur.policy, which was created
some 9 years ago to remove the code debate from all the other NGs.
I'm not at all sure why the topic is x-posted to the .digital NG.

>The fact is, that after April 15th, CW is effectively dead as a political
>tool.

It never was a political tool. Only (and still) one of the top used HF
modes.

>Get over it.

Over what?

I look at this subject from another point of view. Why just think of asking digital gurus to be hams? Why not also encourage hams to become digital gurus? We need more license classes for all who can qualify to be advanced communicators both analog and digital...using media from DC to light!

Hams need more license classes to maintain their basis and purpose of being state of the art communicators and capable of forming a cadre of experts!

1331. rfi hash

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-20 00:00:00 UTC
From: jclind@sentex.net
Message-ID: <38d59281.46943347@news.sentex.net>
Source record: 13517

Hopefully someone can help rectify the following situation.

I moved 2 pc's from my desk to the far side of an 'L' shaped desk (ie the outside of the extension). I then needed extension cables for my CRTs, keyboards and serial cables for my TNCs. I also installed a 1200W UPS which has both PCs, my printer and a scanner plugged into it.
As soon as I powered up my WIn98 machine, I got a tremendous amount of RFI which seems to start at about 10MHZ and gets progressivly worse (louder) up to 30MHZ.
I have winpsk running and I can see a spike about every 78hz. It disappears about 10MHZ and gets higher towards 14MHZ, lessens to about 18MHZ then gets really bad about 28MHZ. It is there throughout the 10-30MHZ range. I put about 24 or so toroids, snap on chokes etc on the various cables with little effect on the rfi. Short of un-doing the changes, can anyone suggest things that can be done to help reduce the crud so the radio (a kenwood TS440S) is usable and I don't see spikes every 78hz??

thanks

Jeff, you seem capable of ignoring the reality that you can hear a larger percentage of CW signals than SSB signals. That doesn't mean that the SSB signals are not there. It just means that you can't hear them. Out of sight, out of mind?

You freely admit that CW gets through when you can't even hear the SSB signal at the same power level, yet you insist on counting all the CW signals that you can hear and ignoring the SSB signals that you can't hear. You just cannot have it both ways. To normalize the count you must not count any CW signal below S3. Your count is probably off by at least a factor of two.

First find out which of your many changes is causing it.
(by unplugging cables, removing your UPS, etc until you isolate the cause)

Depends on the implementation. My version just waits for the regular
broadcast, but a modified TheNet version from Belgium sends immediate
updates. However, that software has now switched to a VC between nodes
and a completely different protocol (of course only between compatible
nodes)

>I had in mind something "realtime". Played with it
>a bit and it seemed useful, at least in networks where nodes come

That is something that should be avoided... use a permanently available
gateway and/or combine it with the net/rom node.
(IP routing in the nodes, that is what you need)

>I like the "idea" of immediate passing of heard node broadcasts,
>but there is a large hazard of creating broadcast storms this way.

It is being done, but with large changes to the protocol.

>cause continuous node broadcasts from three adjacent nodes.

That is not so bad as long as the links are on isolated frequencies,
which they should be. Saving your nodelist to disk is potentially much
worse. I tried this, but you will have to use a reliable timestamping
method (which was not available in those days as many of the old PC's used
at the nodes had no CMOS RTC) and/or you have to mark the loaded-from-disk
nodes in such a way that they *never* are broadcast until they are
confirmed in a neighbor node broadcast.
When you don't do this, you will see old and forgotten nodes appear and
re-appear in your list for months! Believe me, I have tried it.

So, it is better to always start up "clean" and ask the neighbors what
nodes there are.

>Right now watching K-net drop two of every four ip packets presented.
>Every time, without fail. It's not running out of buffers. Just drops 'em.
>Will pass six frames in connected mode, but only two at a time unconnected.

Maybe this is by design. I think the limits are a bit low, but you
certainly need to have those limits.
(I use something like 20+maxframe for connected, half of it for datagram)

>> Stupid TCP options like "no backoff" or "linear backoff" have been built

>reputation in some areas (smile).

Sure. The problem was that the "inventors" of this stupidity (Mike
B. etc) would not listen to theoretical arguments from Phil and others,
but just went ahead.

>> There exists a German hack to send IP frames in normal pid-F0 packets.

>Not so good. I may play with some ip-over-nr that uses NET/ROM
>connections to see how well that works. i.e. encapsulate in pid-CF frames.

But that can only work when you define a new protocol or the endpoints
agree that all traffic towards them is IP. The PID is not transported
in NET/ROM connections :-(
There will be not much difference anyway, unless you are using multi-hop
NET/ROM connections. With a single end-to-end connect the packets between
the nodes are datagrams anyway.

Hmmm ... think I have something different in mind.
In the case of interest, all stations are nodes, and all route.

Not sure how this occurs, other than some software bug.
Computer clocks are quite accurate, and it is simple to avoid
broadcasting long dead routes.

> So, it is better to always start up "clean" and ask the neighbors what
> nodes there are.

Certainly not when a node is shut down for a few minutes (or even hours)
of maintenance, which is the usual case here.

Several possible solutions here, some involving simple changed to the
NET/ROM protocol. G8BPQ did that already, so I'm not adverse to
using an extra bit (or byte) in the L4 connect request and connect

acknowledge to indicate "I encapsulate ip". Similar idea as the SABME ...

> There will be not much difference anyway, unless you are using multi-hop

If it's single hop, we don't use NET/ROM connections.
There is only one station using ip that is a direct connect for me. All the
rest are several to many (3-6) NET/ROM hops away. Big wide open spaces
out here in the Western USA.

I'm looking for a simple keyboard program for sending Morse code. Want to use it with a cw qrp rig, so the interface must key the transmitter directly, i.e.. Hamcomm won't work. Any leads will be appreciated.
Thanks
John

Hi, I just started to experiment with some of the software that uses
the PC sound card to decode the digital modes and was amazed at how
well it works.

Anybody thinking of trying some of the digital modes should take a
look at:
http://aintel.bi.ehu.es/psk31.html

Lots of good PSK31 info and links to digital software.

TRUETTY is listed in link above and can run RTTY as well as PSK31.

I hope this helps,

Dale

Hi All,

I am in desperate need of a schematic and parts list w/ numbers for the
Agrelo DFJr. antenna array. The J. Agrelo story is just too painful so I'll
spare you the details.
Thanks to Steve, WA3SWS for the info he sent me.
This unit had RF applied to the RX port and the little rx amps are blown.
Looking for those parts numbers.

Any and ALL help is greatly appreciated!

You are not counting the QSOs, Jeff. You are counting the QSOs *that you can hear*, a very subjective situation. The ratio of the number of CW QSOs that you can hear to the number of SSB QSOs that you can hear is not anywhere near the ratio of total CW QSOs to total SSB QSOs.

You can't work someone if you can't hear them but it doesn't mean that they do not exist.

I have heard that signal on most ham bands above 20 meters. It is a good
way to find the MUF.
I have two theories. 1) It is some kind of natural signal that is running
near the MUF, or 2) it is over the horizon radar, less annoying than the old
woodpecker style radar. I don't think it is natural.

Thanks to everyone who responded... especially Jack, WA9FVP, who
correctly identified the signal as ALE, or Automatic Link Establishment.
ALE is a protocol for automatically determining an available channel on
HF frequencies. Radios that implement ALE are currently being sold by
Motorola and others.

Check out:
http://www.motorola.com/LMPS/RNSG/mobiles/micom/micom_2e/

Also, a ham in England has written software to implement ALE protocol
on two specific amateur radios, including the ICOM 706.

Check out:

What you are hearing is standard ALE (Automatic Link Establishment)
signaling
I have a Motorola MICOM-2R with ALE .. What you hear is very characteristic
of this protocol, it uses a special signaling modem with 8-tones, referred
to as an
"8-ary" modem ..

It must be interesting to look at new web site
Joseph Picasso ïèøåò â ñîîáùåíèè ...
Greetings everyone,

I realize that no one likes spam in the newsgroups, but I just wanted to let everyone know about upstage.com, a new web site that caters to independent artists, entertainers, and other talented individuals. We're not trying to sell you anything, I promise. We're simply trying to build an online artistic/creative community comprised of visual artists, digital artists, performers (actors, dancers, etc), models, filmmakers, musicians, and writers. Upstage is a place where everyone can showcase their work, collaborate with other artists, get the latest news, and win the trip of a lifetime. We think we're doing some great things, and we would like to invite you to join us.

We're currently running a web-wide talent contest where 7 category winners will be determined by vote of their online peers. Whoever wins is going to Europe for 7 weeks with six of the other winners and an upstage.com film crew. The whole trip will be filmed and webcast, with the resulting movie to premiere at a variety of film festivals. Check out our site at www.upstage.com and please don't hesitate to contact me if you have any questions or comments. I am at jpicasso@upstage.com.

Thanks,

Joseph Picasso

>> (IP routing in the nodes, that is what you need)

>Hmmm ... think I have something different in mind.
>In the case of interest, all stations are nodes, and all route.

Then you can use plain AX.25 on the last hop. So your node network
internally uses NET/ROM and routes IP over it if it cannot be avoided, and
the end user stations use plain AX.25 UI or VC links to the nearest node.

>> When you don't do this, you will see old and forgotten nodes appear and
>> re-appear in your list for months! Believe me, I have tried it.

>Not sure how this occurs, other than some software bug.
>Computer clocks are quite accurate, and it is simple to avoid
>broadcasting long dead routes.

Clocks may be accurate but sysops aren't. I have included some commands
to sync clocks between nodes and I multicast the clock time as part of
a node info multicast packet, and I still see big differences in clock
time between nodes.

The problem with my implementation may have been that there were two
separate commands, one to load a table from disk (this was just the
standard "source" command) and one to save a table to disk at regular
intervals. This provided plenty of opportunity for the careless to
foul things up: remove the save command but leave the file on disk and
the source command that reads it, for example.
So the file data had to have some reliable "age" info, something that
the node in normal operation stores in a downcounter that is decremented
at regular intervals. Of course the counters don't decrement while the
file is on disk.

Over time I have learned that one should avoid any involvement of the
node sysop in accurate functioning of his node: either he does not care,
he does not want to study the matter and just carelessly copies a config
from a friend, or he thinks he understands it all and starts to modify
every line in the file to leave his mark on it.

The Flexnet people have understood this as well and have removed all
configurability... unfortunately the structure of the NET/NOS config
does not lend itself well to removing, because the items in the config
file often perform some "action" during startup. That is more difficult
to hardwire than just fixing a set of values.

So, I decided just to remove the function. Transmission of a few seconds
of node information at restart time (which normally occurs at intervals
of several months) really is no problem.

>> So, it is better to always start up "clean" and ask the neighbors what
>> nodes there are.

>Certainly not when a node is shut down for a few minutes (or even hours)
>of maintenance, which is the usual case here.

Why not?

>> But that can only work when you define a new protocol or the endpoints
>> agree that all traffic towards them is IP. The PID is not transported
>> in NET/ROM connections :-(

>Several possible solutions here, some involving simple changed to the
>NET/ROM protocol. G8BPQ did that already, so I'm not adverse to
>using an extra bit (or byte) in the L4 connect request and connect
>acknowledge to indicate "I encapsulate ip". Similar idea as the SABME ...

I was not aware that G8BPQ code had such an extension.
There are other extensions, by G8BPQ and others, but I cannot oversee
quickly if you could add such an extension and have compatible behaviour.

>> There will be not much difference anyway, unless you are using multi-hop
>> NET/ROM connections. With a single end-to-end connect the packets between
>> the nodes are datagrams anyway.

>If it's single hop, we don't use NET/ROM connections.
>There is only one station using ip that is a direct connect for me. All the
>rest are several to many (3-6) NET/ROM hops away. Big wide open spaces
>out here in the Western USA.

Of course I don't mean single AX.25 hop between the endpoints. The number
of hops at that level should not matter.
I mean the practice of using several back-to-back NET/ROM transport level
connections between te endpoints (by first connecting to some node, then
onwards to the endpoint)

What you need is: nodes that understand and route IP. Then you are only
involved with the connect to your local node, and it does not matter if
it routes your IP packets over NET/ROM or over plain AX.25 circuits or
datagrams. In a network of a large number of such nodes, IP packets can
be transported over a mixture of different methods. They usually won't
take 3-6 NET/ROM hops at a time, but it could be done.

Sorta like trees falling in the forest making a sound, or the fridge light going
out
when you close the door. We never see or hear that, but we know it
exists. Same with Saints, Angels, and Demons. You have to include these
in the count, as even if you can't hear or see them, "it doesn't mean that
they do not exist."

Jesus, is it just not possible on USENET to have a discussion about a topic without it degenerating into a defense of Morse Code? I am so sick of hearing how great or how not-great Morse Code is .... give it a rest, say, maybe ten decades or so.

Ok, I'll give you guys a hint... ALL religions depend heavily upon circular
reasoning.

In my case, the fact that I have never personally met J.R. "Bob" Dobbs in no
way indicates to me that he does not exist, and does not lessen the profound
spiritual satisfaction I find in the Church of Bob.

http://www.subgenius.com

You can all laugh now, but when the Hist "X-ist" UFO's arrive on XXX-day to
take all of Bob's children on to a better shopping experience, you "pink
boys" will all be writhing in agony, like worms in a bucket of kerosene!

On "X-day" and "XX-day", the aliens mysteriously failed to appear, perhaps
because the Clinton administration made them doubtful as to the utility in
saving any humans. But now we are trying again, pinning our hopes upon this
year's "XXX-day", if we can only keep the inventor of the Internet out of
the nation's capitol on that day so he won't disgust the Hists like his boss
did.

After all, nobody has ever SEEN the Hists, but as we all know, that in no
way precludes their existence. In this light, the Church of the Subgenius
holds the same validity as any of the other organized religions.

After all, it's not like you have to go to school and study for years in
order to employ circular reasoning. It's (quite literally) a no-brainer.

I've been hearing a strange signal on 17 meters lately, and I cannot identify it. I have a 15 second sound bite on the web which was recorded on March 22, 2000 at approximately 0500Z on 18.090 MHz, and I tuned up 1 KHz during recording. I think it sounds like water falling over rocks. If you know what this signal is, please send me an e-mail, and I'll post the answer.

Here's the URL pointing to the sound bite (100KB MP3).
http://www.mcs.net/~mikebo/personal/water.mp3

Not a problem for us, since there are no "end user stations".
All stations are equal in terms of their networking capability.

Understand. I did things a bit differently, and do not allow any
"user control" of the process. i.e. state information is timestamped
and automatically saved at regular intervals.

> Over time I have learned that one should avoid any involvement of the

Exactly.

I split the configuration into two parts: defaults and user specified.
Many parameters cannot be changed by the user.

> So, I decided just to remove the function. Transmission of a few seconds
> of node information at restart time (which normally occurs at intervals
> of several months) really is no problem.

Makes sense in that particular situation. I'm designing toward a
different situation where users come and go at will.

A quick test, against BPQ, K-net and NET/ROM worked ok: the extra
octet was ignored and caused no problem.

Not done here.

> What you need is: nodes that understand and route IP. Then you are only

> take 3-6 NET/ROM hops at a time, but it could be done.

I still do not understand "connect to your local node".
Every station is a "local node". The "users" ARE the network.

From here most connects take 3-6 hops because the users I wish to
exchange information with (e.g. access their web pages) are that many
hops away from here.

Interesting discussion ... will play with some of the ideas and see how
well they can be made to work. Results, if useful, will appear in SNOS.

I'm not sure what you mean "compares with Digipan".

What attributes or features are you really looking for?

For example, WinPSK (and its offshoot WinPSKse, which is my attempt at adding features to WinPSK, mainly the ability to deal with two receive signals at once) has really good DSP and seems to be able to handle much weaker signals than some other programs.

Logger has significantly fancier logging and handles PSK31 decently.

Pointers to these, and others can be found at www.psk31.com, as well as possibly other sites.

From: george@agora.rdrop.com
Message-ID: <38da475b_3@news5.newsfeeds.com>
Source record: 13463

I've run across a small box with the label FSTV "TR70A"

Can anyone tell me more about this device?

The front panel has a power switch and what appears to be a tuning dial.
The back has an antenna jack and what appears to be an output for a television.

Anyone have more information?

Thanks,

George Rachor (KD7DCX) (Yup.. a beginner)

12:00	Lunch break		
-12:45			
12:45	Closing discussion		
-13:30	Possible subjects:		
	- We need a new "Mailbox"-System		
	- We need a new network		
	- We need fresh people		

Workshops:

1.) Linux workshop
The Linux workshop will be guided by Hans-Peter Zorn (DG4IAD), Robert Stein-Haeusser (DL1NC), Matthias Welwarsky (DG2FEF) and Jens David (DG1KJD) this year. It will take place during saturday and consist of two parts.
The first part starts at around 11:30 and consists mainly of an installation party. It is our aim to provide every participant with an useable, working

Linux packet radio system and basic understandings about how it works. To achieve this, you have to bring your PCs with everything you need in order to operate it (i.e. display, keyboard, cables, mouse, packet radio equipment). There has to be enough free disk space on your HDDs (at least 500 MB) and if possible one free partition entry in your partition table.
Please remember to back up all important data on the system before daring the trip to Darmstadt because until now we managed to kill nearly every system. :-)
The workshop includes:
- Installation of a common Linux distribution
- Basic configuration of the system
- Configuration and recompilation of the Linux operating system core (kernel) with support for the new AX.25 stack
- Configuration of the AX.25 and network subsystems
- Installation and configuration of the graphical packet radio terminal "LinKt"
- Installation and configuration of TCP/IP and applications using it (e.g. Netscape etc.)
At around 15:00, when everybody should have a useable system, we can start destroying it again by applying our programming skills. :-)
Hans-Peter will show us, how to design C programs which communicate with the outer world using the common socket interface provided by the AX.25 core.
Of cause, if the number of participants permits it, we could also do something completely different.

2.) 9600 baud workshop
Here no real program exists. You can bring your transceivers including power supply and AF cables.
Andreas, DL2FZN will answer your questions, test the radio for usuability with 9k6 and give you advise in how to achieve it. This workshop also starts on saturday at around 13:15.

3.) Pager workshop
Holger, DB6KH guides a pager workshop this year. It is about converting standard commercial pagers (Quix, Telmi, ...) into ham radio equipment (i.e. to receive, in the 439 MHz band). It starts on saturday, 13:15. Bring your pager and your electronic skills...

If I understand correctly, the following circuit should do
the trick. Drawn in fixed font (Courier).

```
C
20K |----to PTT
RTS-----/\/\/\/\/----+-----|| 2N2222
| B |----to ground
--- E
diode /_\
|
+--- to ground
```

How do you access one of these TNCs
via the computer port with a Win98
computer? I have been told that the
TNC can only talk to a DOS-based
machine...

Help!

Any assistance would be really appreciated.

Thanks for reading

You can use hyperterm under Windows 98 to access it. Any computer, Windows, DOS, Linux, Mac can talk to a TNC since it's just a serial device.

Source record: 13472

A single 2N2222 should function adequately as the switch for your PTT line. Connect the RTS line from the serial port through a 1K or so resistor to the base. Ground the emitter and connect the collector to the PTT line. When the RTS line goes from about -10 volts to +10, the transistor will be turned on and the PTT line will be grounded through the collector/emitter circuit. A current of 15 ma can be easily handled as can the 13.5 volts open-circuit voltage on the line.

If you have any trouble, try different values of base resistor until you find what turns on the transistor.

You can, of course, use a relay provided that the current it draws for the coil does not overload the RTS line. But, the transistor is much cheaper, silent, and works with no time delay either opening or closing the PTT circuit.

Of course, you should not read "end user stations" in terms of their
networking capability, but in terms of their position in the network.

When they are turned off and on at will, they are end user stations.
When they are on 24hrs/day and available for everyone else to route
packets through, they are network nodes.

A network node can be used as an end user station at the same time.

What I meant to say is that there cannot be a default value for something
like "start smtp". It is not a value, it performs the action of starting
a server.

When you want to hardwire such things you will either need a table of
config commands built into the executable and run as an autoexec.net, or
the code will have to be restructured quite a bit.

>> I was not aware that G8BPQ code had such an extension.

>A quick test, against BPQ, K-net and NET/ROM worked ok: the extra
>octet was ignored and caused no problem.

I mean: how do you connect to another node and detect if it can handle
your new protocol, will just ignore your extension (and in this case:
malfunction because the PID will be dropped) or will refuse your connects?

This extension will be like the extended sequencing, in that it will most
likely need a separate table with callsigns that can handle this new protocol.

Well, routing IP over NET/ROM already requires far too much user
configuration, so this extra bit can probably be added.
It would, however, be more constructive to work towards an auto-configuring
autorouting IP protocol that has functionality like Flexnet but uses IP
addresses instead of AX.25 callsigns.
As IP supports the notion of subnets, it would be better scalable than
Flexnet, and it would also better suit todays network applications.

Building this on top of NET/ROM is just as bad as trying to route IP over a
Flexnet network...

1388. RadioRaft, multimode decoder software, new version

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-24 00:00:00 UTC
From: Fran&#65533;ois Guillet <francois.guillet@free.fr>
Message-ID: <8bftik$qg2$1@wanadoo.fr>
Source record: 13474

Hi All

The new version 3.20 of the multimode decoder software "RadioRaft" is now
available.
It decodes automatically 30 modes of radio transmission as ARQ, FEC, Packet,
Pactor-I, Pocsag, Acars, Gmdss...
DGPS is among the new ones.
The continuous printing is now possible. The new version has also many other
improvements.
For more details, go to the RadioRaft official site at:
http://pro.wanadoo.fr/radioraft/
or mirror site: http://radioraft.free.fr/

To update your previous version 3.00 is free by Internet.
The not yet registered users may download the free version including now CW
Morse, FEC-A, ARQ-E, RTTY Baudot and DIGIT, a powerfull tool for radio data
analysis. The free version is not limited in time.

Good decoding

73s Francois Guillet F6FLT

Is that what it said? I think you've managed to convolute the results
of a survey which I thought had some badly worded questions on it.

I don't think there is any civil or criminal penalty for lying to the
ARRL.

All our stations are network nodes in that definition. Since some are located
in very remote areas (and may provide the only connectivity to others
located in other very remote areas) it is important to us that whatever
protocol is used can adapt fairly quickly when paths come and go.

To explain a bit more: the philosophy is to provide SOME sort of
initial connectivity into remote areas whenever any ham who lives there
wants to play with networking. Often this might require something like
a 200 km. fairly poor link to get things started. Those links might work
only part of the time, but for the hams involved they are the ONLY
possible links initially. Once activity has grown and intermediate sites
can be supported the connectivity can be improved. Until that happens,
the network needs to be able to support connectivity that comes and
goes over periods of hours, or sometimes even days. The issues are
very low population density and very difficult terrain. See a map of
eastern Oregon and Washington for one example, and the coastal
area of Oregon, Washington and California for another.

> A network node can be used as an end user station at the same time.

Exactly.
The majority of our nodes are like this.

"the code" in this case is SNOS, it is structured a bit differently than
the common *NOS flavors.

> malfunction because the PID will be dropped) or will refuse your connects?

If the other node can handle the extension, it will report this fact in the
connect acknowledge, as BPQ does. If it cannot, the existing protocol
(AX.25 at layer 2, NET/ROM at layer 3) would be used. Much larger
issue of capability negotiation might be an interesting future discussion.
BPQ has the extra byte in the connect acknowedge. If you get an ack
with the extra byte, you know your connect target is BPQ. I'll ignore the
fact that not all implementations of the BPQ extensions to NET/ROM
work the same: that is a different discussion about standards setting
processes (or lack of same ...) within ham radio.

The test bed for some of these ideas was DIGI. Tossed that code after
doing the experiments. It could route AX.25 connections automatically.
i.e. if an AX.25 connect was attempted to a station known to any DIGI
node in the network, the connect would be answered by whatever DIGI
node heard it and the frames routed transparently to the target of the
connect request, whereever it was in the network. The experiment was
mainly about inter-node exchange of routing information ... the technique
would work equally well for any address type (IP, NET/ROM, AX.25).
Think of a distributed database and how synchronization should occur
between multiple instances of that same database. Model is WP.
Small incremental updates sent fairly frequently. Less update overhead
than NET/ROM because of greater intelligence in each node, thus
less information needs to be exchanged, and is only exchanged when
some bit of routing information changes. Yes, this did require a "triggered
database load" when a naive node first came on air.

> This extension will be like the extended sequencing, in that it will most
> likely need a separate table with callsigns that can handle this new
protocol.

SNOS marks which nodes are "BPQ capable" when it discovers them.
My first guess is that a similar approach could be used for other extensions.
Experimentation will be needed to verify this. Will be a while before I
get to this part of the project.

> Well, routing IP over NET/ROM already requires far too much user
> configuration, so this extra bit can probably be added.

Yes indeed! Thus SNOS, which requires much less user configuration.

One of the goals is minimal user configuration required. Nowhere near
done with that part of the code. Experience to date is that a user (node
owner with 8 radios) unfamiliar with tcp/ip was able to bring up SNOS
to replace BPQ in less than one hour.

> It would, however, be more constructive to work towards an auto-configuring
> autorouting IP protocol that has functionality like Flexnet but uses IP
> addresses instead of AX.25 callsigns.

Not quite sure what you mean: create a new protocol to replace AX.25
or create extensions to NET/ROM to handle things it cannot presently
handle such as RIP and other broadcast IP or just start from scratch?

> As IP supports the notion of subnets, it would be better scalable than
> Flexnet, and it would also better suit todays network applications.

> Building this on top of NET/ROM is just as bad as trying to route IP over a
> Flexnet network...

Two issues here. First, NET/ROM support is needed because NET/ROM
networks exist. Second would be new layer 2 and/or layer 3 protocols that
are not compatible with AX.25 and/or NET/ROM. For me, not an option
yet because there is nobody to test with. Perhaps sometime in the future.

> Rob

Again: thank you for your continued comments on these issues.
They have been very helpful!

I am trying to activiate for the first time a KamPlus v.8 and really know nothing about the software available. I am a relic from the 1960's. relicensed in 1997 and looking to avoid making a few mistakes. I will be interfacing with a FT-1000MP, and possibly a Kachina 505DSP at some point later.

I am looking for windows based software to run on Windows 98 for both HF and VHF. Don't ask me what I want to do, as I really don't know. VHF packet and some of the common HF modes would be nice for starters. Obviously, a package that is flexible would be a plus.

I see the main programs out there are KAWIN, KaGold, and PKGold. What are the advantages and disadvantages of each? I am looking for a short cut to tap into the experience of others, and would prefer to not have to buy all of them to try to find out myself. Remember, I am Rip Van Winkle, and I just woke up from 1967.

Thanks in advance & 73

Ray K1XV

Ray, I am currently running a KAM+ v 8.0 with PacTerm98 v 1.4. I have used Hostmaster in the past which is a DOS based program and was very good for my application, which is general HF ragchewing and running packet on the VHF screen but was not a Windows program. When I decided to upgrade to a WIN95 program I got Easyterm which I was never able to get to run the way I wanted. Easyterm does has some nice features . To be fair I was switching between a PK12 and the KAM and I think I messed up the configuration files so the program not running was my fault. I then started using PacTerm98 which for me is the best solution. Its very simple to use, has excellent support, and has been very stable for me with Windows and a KAM+ (I can't screw it up). Remember I use it for general ragchewing on PACTOR and running a packet station on VHF. I have never used the other programs you listed so maybe someone else will tell you about those.
There is an excellent page you can check for wiring up your connections to the radio / KAM and it is http://freeweb.pdq.net/medcalf/ztx/wire/index.html
I hope this helps and if you have any other questions please feel free to send me a email at " rfay@pclink.com " and I hope to see you on the air in the near future.

YOu can access them with anything that will use a rs232 com port. If you want to you can use the terminal program in win 98 to access the TNC. You just do not get the ability to use the 'ease of use ' that specific THC softwear has.

Just set the comport you want to use to the speed of the TNC, connect a serial cable to the com port of the computer and then fire up any win98 program just like you would an external telephone modem.

Can you tell me why I'm hearing ALE on 17m ham frequencies?
Is that band shared with some commercial or military user of ALE,
or are hams actually using this protocol to connect to a set
group of users?

Are you using your MICOM-2R for commercial or amateur use?
How much did it cost? I'm guessing in the $3k range.

Can anybody tell me now to use the Upload command in the DataEngine to upload software ?.

I wanted to try uploading the G8BPQ software into ram for testing. My Data Engine has 256K of ram

The manual just says to look in the Developer's Manual.

I assume it needs some parameters ? Maybe Starting Address and Data Length ?.

Is there a site around with some of this info. I have looked at most of the usual packet sites.

Thanks.
Dan

> usual packet sites.

Quoting from the manual:

When the DE receives the command "UPLOAD HEXFILE", it will output the message
"send Intel hex file" and then wait for a hex file to be uploaded to it. The
hex file should
be in the form defined by Intel using EXTENDED ADDRESS RECORDs. There is no
default segment defined so an EXTENDED ADDRESS RECORD must precede any
uploaded data. During the upload, DMA and interrupts are disabled and only the
stack
(0040:0000 through 0060:0000) is used for temporary variables. After the
loader has
read in a valid checksum in the EOF record, the loader will read and throw away
one
more byte and then jump to the start address specified in the last START
ADDRESS
RECORD. If a START ADDRESS RECORD has not been received, the DE will jump
to FFFF:0000. If during the upload an incorrect checksum is received for a
record,
the DE will do a soft reset.

Usually BPQ is run from a second EPROM in the data engine, and selected via
the option switch on the front panel. However, it should be possible to upload
it (or any other software) via the UPLOAD HEXFILE command.

>Thanks for reading
>John

Not that it matters but a win98 machine IS a dos-based machine.
As to what OS is required for 'talking' to the tnc, someone gave you wrong information. Time to look for another mentor. Ya might want to hold off asking questions for a while and get a little background on the subject. There is a ton of info out there on tncs and interfaces.
FYI:
The 1270 is just a serial modem type device with several rather odd-ball control command sets to choose from. Assuming you are using the default tapr command set any dumb-terminal emulation program may be used to get the tnc 'talking'.
-good luck

Rtty and PSK31 have nothing to do with the CT-17 level converter. All you need to do is take audio between the rig and the sound card plus a PTT line. Do a search on "PSK31" and look at some of the information available on how it works and how to do the interface. You can be receiving with nothing more than a shielded cable from Radio Shack.

The CI-V interface allows a suitable computer program to set frequencies
and modes on the radio, read the S-meter, that sort of thing. If you
have a program that integrates this with RTTY or PSK, there is some
potential coolness. More so with packet, I should think.

If your radio has a "transmit" switch you only need the audio conncections
for PSK31. It is more convenient to have the RTS signal on a serial
port perform this function; an NPN transistor, resistor and diode are
sufficient for this function.

1403. Sound card programming

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-25 00:00:00 UTC
From: kenk@primenet.com
Message-ID: <8F02677AEkenkprimenetcom@206.165.3.80>
Source record: 13489

I'm assuming this NG is appropriate for this question because
much ham software uses sound cards these days.

Are there any books in print on programming sound cards? I've
had an order in for the out-of-print _Using Soundbaster_ at
Amazon for two years with no success. I tried "soundblaster" and
"sound card" in searches at B&N and Amazon with no success.
"Sound" gets several thousand titles - too many to look at.

Any suggestions? Better search phrase?

Ken

To add to information I sent in email:
You don't have to have a CT17, but IIRC, Writelog can use the serial
radio port to put the radio in TX mode, at least on some radios.
I don't recall if this works with ICOM radios, but it is a
possibility, but not the most common.

The first source on programming anything Windows is
the Microsoft Developer Network library. Turns out
they have most of the documentation on the net at
http://msdn.microsoft.com, I think. Though if you
want CD's, you probably want to buy a subscription
and a copy of Visual C++ and all that. I know the
DirectX examples have source code samples for sound
that work pretty good as long as you have a recent
version of Visual C installed. I assume there's
stuff in there for non DirectX sound, though I haven't
ever used that myself. I believe the cheap version
of Visual C++ will work with the examples. It used
to be that the documentation was on the website
but the examples weren't, but last I looked it seemed
that the examples were there also.

Basically, if you want to go cheap, buy the entry-level
VC++ and then scan the microsoft website for the information.
If you want all the documentation on CD, then get the
VC++ professional -- though this is like $500 or something,
I think.

Actually, the DirectX sound is pretty straightforwards
once you get used to it. I have first hand
experience with this. Though I've heard that
there is some brain damage with some sound drivers
not working with full-duplex in DirectX. And, this
is why some people don't use DirectX. Though me,
this has never been an issue. I have zero experience
with non-DirectX sound, though I assume it must
be documented somewhere in there.

Typically with the DirectX stuff you'll have a huge
array of CAPS bits for various weird functions, some
of which will or won't work on various sound cards.
Best is to start from the examples and not write code
from the documentation -- been my experience.

While the hardware is the same, the programming is operating
system dependent.

As others have mentioned, use Windows API functions under
Windows 95/98/NT/2000.

Linux: open() /dev/dsp and use ioctl()/read()/write().

DOS: consider an upgrade.

Getting the samples is easy. What you do with them is where
the fun starts!

1409. Digipan Com port configure problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-25 00:00:00 UTC
From: kenk@primenet.com
Message-ID: <8F02A9C3Dkenkprimenetcom@206.165.3.80>
Source record: 13495

I'm trying unsuccessfully to set the serial port in Digipan for PSK31. My modem is Com 3. After opening up the CPU and tracing cables from the mother board, the mouse seems to be on COM 2 and Com 1 is an unused 25-pin connector. To try to verify the mouse port number I looked at Mouse and the Device Manager in the System properties in the control panel but neither tells which port the mouse is connected to. W98 and Norton System Info don't either.

Com 1 gives the "Error opening Com1" when I attempt to configure the port. Ports 2 and 4 do the same. Port 3 doesn't, but I'm sure that's the modem - at least according to Modem in the Control Panel and the DUN setting.

The MB is an Asus VX97.

It doesn't matter if the PSK interface is plugged into the port or not.

I am just setting up to try PSK31 for the first time, so this is not something that was working earlier.

Any suggestions?

TIA

Ken W9NPP AZ

1411. Packet radio cable for Yaesu FT-2400H

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-25 00:00:00 UTC
From: "Bob M." <none@nospam.com>
Message-ID: <sdr26ibglul130@corp.supernews.com>
Source record: 13497

Packet wiring for the Yaesu FT-2400

8-pin microphone socket on the radio: (pin numbers)

```
_____________
| 8 7 6 5 4 3 2 1 |
------|__|--------
```

Radio jack on TNC: FT-2400 pin

RX audio in: 2
PTT: 3
TX audio out: 4
Ground: 5

Although the instructions say to use a shielded wire, I used an $4 unshielded data cable that's available at computer supply places. It works just fine; it's running within inches of the computer, monitor and TNC. The nice thing about these cables is that they have the 8-pin plug at either end. Clip off one plug and install the connector that your TNC needs. If you know another FT-2400 user wanting to get on packet; get a long cable and cut it in half.

There is an audio signal at the mic jack on pin 2. However, it is in series with the volume knob, so adjusting the volume to a bearable level often makes the TNC deaf to packet signals. Putting a dummy plug in the external speaker jack on the back kills all audio, both to the speaker and at the mic jack. What to do?

To avoid the unbearable racket of packet radio, slit the insulation off of the data cable a few inches away from the 8-pin plug. Find the wire that leads to the #2 pin and cut it. Solder a one-foot-long wire to the end of the wire that leads to the TNC connector. (If you solder the 1' wire to the wire that leads to the 8-pin plug, you'll have no audio at all going to the TNC.) Solder the free end of the 1' wire to the tip of a 1/8" audio plug. I found that a shield isn't needed.

When running packet, plug in the mini plug to the external speaker jack on the back and the data cable in the microphone socket. Set the volume and squelch for the TNC and enjoy the silence. For voice operation, unplug both and plug in the microphone.

Now, if you're wondering what the remaining 4 wires on the data cable do, try making a remote-control head. All you need is three momentary switches of the normally-open variety.

Crossing pins 4 and 2 flips back and forth between memory and VFO operation.

Crossing pins 4 and 7 starts/stops the up frequency movement. Tap for incremental movement; hold and release for scan.

Crossing pins 4 and 8 starts/stops the down frequency movement. Tap for incremental movement; hold and release for scan.

Hi, there is a link to TRUETTY at:
http://aintel.bi.ehu.es/psk31.html

TRUETTY does both PSK31 and RTTY

Also - there is a excellent manual on how to set up WinPSK in .PDF
format at link above. I found it very useful to help set things up.

I hope the helps,

Dale

You might try XPWare by KF7XP. A fully-functional demo version is
available on his website. Works very well with the Kam.

I used to have a lot of interference problems until I made my TNC <-> Radio cables using Category 5 network cable. This, along with making the cables long enough to have the radio on the other side of the room from the tnc, seems to have fixed most problems.

1423. PSK-demodulation - how ???

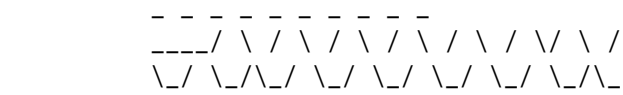
Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-28 00:00:00 UTC
From: Morgan Gunnarsson <di98gumo@chl.chalmers.se>
Message-ID: <38E097EE.4C36A006@chl.chalmers.se>
Source record: 13409
Cross-posted to: comp.sys.ibm.pc.hardware.comm,alt.radio.pirate,aus.radio.amateur.digital.misc,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,sci.electronics.design

How do I create a signal with the same frequency and phase as an
incoming
PSK-signal (se below), without the use of a local oscillator? The actual
incoming signal is not looking as good as the one below, because you
have to
BP-filter it before its transmitted, of course, so its not a good idea
to
just try to detect the zero-levels. Any suggestions?

The original problem is to demodulate the PSK-signal, but I guess its
just to
multiply the two signals, integrate (C), and then detect the levels with
a
comparator(?).

My other question is:
Is it possible to create a sharp BP-filter by using a XTAL, where f0_BP
= f0_XTAL?

Incoming signal:



1 0 0 1 0

Generated sync signal:

Morgan

1425. Audio distortion with PTCII and Kenwood TS450

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-28 00:00:00 UTC
From: svcfish@yahoo.com
Message-ID: <8bqs7k$e4q$1@nnrp1.deja.com>
Source record: 13411

For the past year I have been using a SCS PTC-II to do Pactor II email from my sailboat while cruising the Pacific Coast of Mexico. The PTC-II is connected to my Kenwood TS-450 via the auxillary port in the rear of the radio. It works great except for the fact that the radio totally distorts the broadcast audio when the cable from the PTC-II is plugged into the auxillary port. Since I use the radio on a daily basis for both digital and audio communications it is a bit of pain to keep removing and replugging the plug on a 2 to 3 times per day basis. The way the radio is installed on the boat the back of the radio is not very accesabile either but I manange.

SCS is aware of the problem with the Kenwood TS-450 but has no knowledge of a fix. Does anyone know of one ?

I may decide to replace the radio with a newer model, does anybody use a Kenwood TS-570D with a PTC-II or PTC-IIe ? Does it exhibit the same problem ?

How about one of the newer Icoms or Yaesus ?

Thanks for any help.

Hello all,

I have downloaded JVCOMM32 from the JVCOMM website but I am having a bit of a problem running the program.

When I start the program I get a message telling me that the exe file is corrupted and that this was most probably caused by a virus. I have run McAfee Virusscan and tried to re-install the program but still get the same problem.

Any help on solving this problem would be appreciated. Please reply to joe@g4wjr.freeserve.co.uk

Cheers - Joe, G4WJR

The IC-706 works like a charm with the SCS PTC2e. One quirk -
I installed a 500Hz (FL-100) filter and told the IC-706 that
it was an FL-223 (SSB) filter so it would switch the narrow
filter in for PACTOR operation using SSB mode AFSK. I got
my IC-706MKII from AES as a closeout at $998.

The TS-570D does not have that problem. Kenwood has a fix for the 450
(can't recall what it is, right now), but it might be easier to get the
570. I've used the 570 with the PTC-II--works great, and you can use
the 500 hz filter in the IF.

Try generating sync pulses on both transitions and a PLL running at 2x that will run without sync for several cycles without much drift. Then divide the PLL by 2.

This is a known defect with the TS450 and TS850, and effects all TNCs.
There is a fix from Kenwood. I had the same problem with my TS850 and
PK-232 back in 92.

Date: 2000-03-29 00:00:00 UTC
From: Johnny Rico <lawdog2@ibm.net>
Message-ID: <38e21a55_3@news1.prserv.net>
Source record: 13425

Just for the record, I thought the QST review was as superficial as hell. I have used the PK-232, Kam+, and the SCS PTC-II for probably more than 1000 qsos each (Pactor), and there are clear differences between these units that QST totally ignored. Firstly, QST consistently discuses GTOR as though this mode is an effective way to communicate. It is not. GTOR is a buggy, ineffective protocol which breaks link at the slightest hint of QRM, or for no reason at all. Comparing GTOR to Pactor-2 is just absurd. It is no coincindence that this mode is as dead as a doornail. It simply doesn not work well.

Secondly, the KAM+ does a miserable job on Pactor-1. It does not implement the mode correctly -- it totally lacks memory-arq. This manifests itself as poor weak-signal capability. A Kam+ is noticeably less effective on Pactor-1 than even a PK-232, let alone an SCS PTC-II. When I got my Kam+ wired up I was miserably diappointed in its Pactor performance, which was noticeably inferior to my PK-232, and which was buggy besides. The unit presently resides at the bottom of my junk box.

Thirdly, QST's assertion that the PTC-IIE is inferior to a sound card for PSK31 is not supported by my tests. I have run several sound cards in parallel with my SCS PTC-II for literally hundreds of PSK31 QSOs, and I have never noted any difference whatever. Of course the reviewer admitted that he might not be tuning the PTC-IIE correctly. Perhaps he wasn't.

So when the PLL gets a sync puls, it will set its phase to zero? - is it
really possible to sync the PLL?
```

Isn't the problem that the microphone audio input and the auxilliary
audio input pins are simply wired together?

You have to download it again.
The program has an integrity check built into it,
a virus may be the cause,
or if somebody tries to change the exe,
the check routine will give a virus alarm.

Bad times for crackers :-)

Source record: 13432

I have a PK232MBX that I bought back in 1992, and it lacked Pactor capability. I bought the upgrade to enable pactor and the DSP. It seems to work better in situations where there is high noise or qrm. It was worth the money for me because very few stations use Amtor these days, and Pactor is very popular. I've never owned any other TNC so I can't really make comparisons, but I'm satisfied with the performance of my Timewave TNC, and have made plenty of DX contacts with my 100watts and dipole.

Here's my thinking on this. The FCC is a government office. They
use tax dollars to operate with. We also need Volunteer Examiners
to test all the classes, and charge a fee each time.

How can we have more classes and reduce government cost?
Why should all Americans subsidize Ham radio? What do they get?

"Bob Wex w2ilp" wrote

Common sense...and appropriate qualifying exams...
Three classes can't do it!
Please read my post titled "Partitions for Reconsideration of New Ham Rules". I am not alone in thinking that the basis and purpose of Ham Radio says that it is a TECHNICAL HOBBY. I don't expect all hams to be technical experts BUT I would like to think that some Hams may be more qualified in that direction than others. For Ham Radio to get respect (not just an ego boost for individual's self esteem) we need more Hams to be technically qualified at the higher levels of modern communication technology.

Hams need MORE license classes,

Source record: 13436

Hello Marc,that is a typical problem with ICOM and Kenwood rigs as the MIC input jac and the ACC port is wired in Parallel,easy fix is to run complete sheilded lead from ACC port to a small ally box fitted with a 4 pole single throw $2.00 switch,and switch out the Ptc2 BOX . or buy a Yaesu ,i use Clover,PTC2 Ptc1,sstv,psk31,rtty with either of a ft990/920/1000mp all capable of turning on or off the Data port from the front panel.but a couple of 50c din plugs and sockets will do the same job.
hope this helps
Rgds Dennis VK4SX ex VK4DAE.

If you "full way rectify" your signal, you can see that you get a
constant 2X frequency,
regardless of the data inversions.

Steve

> How can we have more classes and reduce government cost?

Since the government doesn't write the question pool and they don't give the exams, how does more classes result in a significant increase in government costs?

> Why should all Americans subsidize Ham radio? What do they get?

Hopefully, they get a pool of trained operators and equipment which is available in an emergency. If the FCC were permitted to charge a reasonable fee and keep the money to supplement their budget, perhaps their amateur operation could become self-supporting.

1454. Trade Hal PCI-4000

The best of the best! HAL PCI-4000 digital modem. Sophisticated DSP
processor performs Clover, RTTY, Pactor, Amtor. Works with Express, XPWin,
Writelog, WF1B, XPPCI. Requires 1 full ISA slot but does NOT require an IRQ!
Card is 'A' model, serial number < 600, with latest proms. Trade for radio
or laptop of equal value.

Digital bridges???
What has an often repeated quote by Kruschev got to do
with "digital.misc."? It isn't even amateur policy.
It is the opinion of a former professional politician.

What about putting a better antenna on the door receiver?
Seems like that would be simpler. Just find the frequency
it's on, and make a little dipole or something -- raise it
up in the air a bit.

Date: 2000-03-31 00:00:00 UTC
From: chiral_dude@my-deja.com
Message-ID: <8c17oa$i7j$1@nnrp1.deja.com>
Source record: 13351

I have one of thoes Genie Intelicode door locks and I like it except for the whimpy range of the keychain transmitter.

I am thinking about building an RF repeater that could pickup the transmitter signal and then give it a boost so it works from 20 yards instead of 20 feet. It uses a rolling code for security so it must be a digital signal.

I am thinking all I have to do is tune it to the transmitter frequency and let it boost any signal it receives.

Am I on the right track or is it more complicated than that? What would I call this circuit/device so I can search for it using a keyword?

Hello if the ic746 has a 8 pin din as ACC1 YOU CAN USE A 5 PIN DIN ok. the pinouts are
AEA COLOR CODE

2..(brown) GND

3(RED) PTT

4 (WHITE) AUDIO FROM TNC)

5 (GREEN) AUDIO TO TNC from RIG

but pleased be advised Icom wire the Mic Jac and ACC1 port in parallel so you will have to remove or switch out TNC to modulate as in SSB.to overcome distorted audio
rgds Dennis vk4sx.

1469. Re: DSP upgrades to PK232MBX

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-03-31 00:00:00 UTC
From: Johnny Rico <lawdog2@ibm.net>
Message-ID: <38e4b8c3_1@news1.prserv.net>
Source record: 13355

I used the PK-232 (pre-DSP upgrade) and a Kam + for many QSOs. In my opinion the PK-232 was clearly better on Pactor (the only digital mode other than PSK31 that I do a lot of)... I would assign a Kam with a failing grade as regards Pactor, while the PK-232 was maybe a C+/B-. The SCS PTC-II is an "A".

Many of the standard programs work. Search on Icom software and you will find some of them. If you can't find anything suitable drop me a note and I will dig something out.

You need a gizmo to level translate from the Icom to the computer. Available from Icom and others or relatively easy to build.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.swap

For sale:
Astron power supply transformers
(1) from an Astron RS-20M
(1) from an Astron RS-35M

I replaced the standard 110v transformers in two Astron power supplies with switchable 110-220v transformers. The transformers which were replaced are now available. They are in perfect operating order, run quietly (these are not hummers!)

RS-20 transformer: 110v ac primary, 34v (no load) ac secondary with center-tap. This transformer is capable of a continuous 16A cont. 20A intermittent current draw. There is a also another secondary winding, 44v ac but I don't know how much amperage draw is capable from it. $18

RS-35 transformer: 110v ac primary, 34v (no load) ac secondary with center-tap. This transformer is capable of 25A cont., 35A intermittent current draw. There is a also another secondary winding, 44v ac but I don't know how much amperage draw is capable from it. $25

Either (or both) would make a perfect replacement for your existing supply, a great addition for the hobbyist or 'built it yourselfer'!

Buyer would pay shipping from S. FL 33478

Vic, KE4QJK

After reading this post I question what benefits the government supplies to amatuer radio? In fact, the regulatory situation arose from the fact commerical interests in the early 1900s saw a potential to make money from radio spectrum and the government obilged them. So who really benefits from regualtions commerical users who make money or people who spend money to play?

Using the logic set out in this post, the FCC should get out of the amauter radio regulation business since we do not make a profit. They should regulate those who do more vigorously! They did just that with CB radio many years ago.

From the drift of this post it seems the public must benefit from all hobbies. Ok let regulate out of business all hobbies that do not fulfill an obligation of total service to mankind. So, into the bit bucket goes Ham Radio, Stock Car Racing, alcohol drinking, drug using, bird watching, sewing, rattle snake handling, motorcycle racing, bicycle racing, and on and on and on.

They allocate spectrum.

> In fact, the regulatory situation arose from the fact
> commerical interests in the early 1900s saw a potential to make money from
> radio spectrum and the government obilged them.

So the telegraph, telephone, and radio were developed for pure socialist
reasons, and not by capitalists? I think all those inventions were invented
to make money, not for the public domain.

The role government plays, is to regulate what would otherwise be chaos.
Consider the amateur rules the FCC just changed. We had a Novice class,
and two levels of technicians. We had three levels of morse code testing.
But if you look at the charts, you see that the trend was no one wanted
to be a Novice, and General, Advanced, and Extra classes were stagnant.
The FCC doesn't wait around till chaos or dysfunction is supreme, the ARRL
incentive class system was no longer functional. It was obvious that the
solution was to delete the classes that were redundant. The system is
now set up to divide classes between below 30 MHz and above 30 MHz.
That does leave the Extra class as a redundant class, but it exists because
Americans like competition, and the Extra class is where people who
want to be known as "going the extra mile" will congregate. For that they
will have some added VEC privileges I guess.

CSS to include access in all of product line, in addition to new Golist for Windows

Muscle Shoals, Alabama. April 3, 2000 Creative Services Software announced today that they have begun negotiations with The Golist to include direct support of Golist in the LogWindows 3.07 and PacTerm 98/ PkTerm 99 programs, as well as begin work on a Windows 32 bit interface for the Golist data..

The GOLIST, QSL MANAGER LIST, is "The Choice of DXers World Wide". It is the most accurate QSL Manager database .

"Supporting the new Golist database in our logging and TNC software continues our support to provide the best software for the ham community" said Rick Ruhl, N4GDO, President and owner of Creative Service Software. "I'm also very excited about working with John Shelton, K1XN, to produce a Windows 32 bit interface for Golist. As an avid DXer, I've always found Golist to be a necessary part of any DXer's ham shack".

Creative Services Software is at http://www.cssincorp.com
The Golist is at http://www.itis.net/golist/

Windows, Windows 95, Windows 98 , Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

For auction:
ICOM UT-106 DSP add-on module for IC-706 MKII and IC-PCR1000
Check it out at:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=297153403

Please not the following correction:
On 3-31-00 I posted this module works with an IC-706 (original), it does
not.
This unit works with the IC-706 MKII or Icoms IC-PCR1000

1484. FS: Astron Power Supply transformers

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-01 00:00:00 UTC
From: KE4QJK <ke4qjk@qsl.net>
Message-ID: <BdwF4.8040$tk.131676@news3.mia>
Source record: 13370
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.swap

For sale:
Astron power supply transformers
(1) from an Astron RS-20M
(1) from an Astron RS-35M

I replaced the standard 110v transformers in two Astron power supplies with switchable 110-220v transformers. The transformers which were replaced are now available. They are in perfect operating order, run quietly (these are not hummers!)

RS-20 transformer: 110v ac primary, 34v (no load) ac secondary with center-tap. This transformer is capable of a continuous 16A cont. 20A intermittent current draw. There is a also another secondary winding, 44v ac but I don't know how much amperage draw is capable from it. $18

RS-35 transformer: 110v ac primary, 34v (no load) ac secondary with center-tap. This transformer is capable of 25A cont., 35A intermittent current draw. There is a also another secondary winding, 44v ac but I don't know how much amperage draw is capable from it. $25

Either (or both) would make a perfect replacement for an existing supply, a great addition for the hobbyist or 'do it yourselfer'!

Buyer would pay shipping from S. FL 33478

Vic, KE4QJK

Tom,

Make sure you're on LSB for RTTY, AMTOR and the other digital modes. If
you're on USB the Mark and Space are reversed and you'll get the random
characters.

Are you using LSB? If I remember correctly mark = 2100 and space = 2300
meaning that you must use LSB even if you are on 20m. I no longer have
a PK232 so somebody correct me if I'm wrong. Also the baud rate between
your computer and the PK232 must be set correctly. Does the PK232
honor your commands and respond with the appropriate characters?

1488. Need suggestions for PK-232 MBX on RTTY

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-02 00:00:00 UTC
From: Thomas Beltran <tbeltran@earthlink.net>
Message-ID: <ycAF4.12753$64.451357@newsread2.prod.itd.earthlink.net>
Source record: 13374

I recently purchased a PK-232 with the most recent update to DSP. This is my first attempt at digital communications. I've hooked up the receiver (Drake R-4C) to the TNC, using the patch cord that came with the unit and a radio shack adapter going from the 1/8" connector to an RCA plug. The software seems to work (PK Term'99), but all I get are random characters. Any assistance would be appreciated. Tom W6EIJ

1489. Re: Need suggestions for PK-232 MBX on RTTY

Source record: 13375

Rick and Cecil: I'm using a Drake R-4C, on which the sideband is set using the "Passband Tuning" knob. I set this knob in the RTTY portion of the band, which is a little below LSB.

Cecil: I'm not sure what you meant when you said "Does the PK232 honor your commands and respond with the appropriate characters?"

I'm using the PK Term'99 software. The setup is accomplished through the menu items, for example, in setting the baud rate. I'm not sure if this is what you meant by honoring my commands.

I can say one thing, the tuning meter on the PK 232 is hard to figure out. I cannot get it to indicate anything like the manaul shows.

Back in the '70's, I went on RTTY using an old manual teletype machine and a demodulator (I think that is what it was called). I would just tune slowly across the signal until the teletype machine began to plunk away. So for the PK-232, I hooked up a Y cable so I could feed the PK 232 and my speaker. I tried various things on various signals (for example, changing the baud rate) to no avail - just gibberish.

Thanks for the replies so far. Tom W6EIJ

Yeah, this is my guess. It sounds like his baud rate or
parity is set wrong. I'd set the terminal to 9600 baud,
no parity. And if that doesn't work, tweak around with
slower speeds and different parity's. And, if that doesn't
work, pull the battery jumper out of the bottom, wait a
bit, stick it back in. And then set the modem to 9600
baud no parity, and try again. I think it waits for
an '*' or something when it starts up to for setting
the baud rate.

And Netpliance is now forcing you to get the service, so by the time
they are available at Circuit City you will most likely be asked to sign
a contract before you can have it.

Of course this could be expected, and it is their rightful thing to do. It
is a device that is sold below cost to use with a service that is supposed
to bring them the revenue. When everyone buys it without the service they
will soon be out of business.

Netpliance also stated that they will modify the newly produced units so
that the published modification is no longer possible. How they will do
that is unclear, but it seems most likely that the IDE interface will go.

I am an audiophile.
I have owned several MD recorders. I am in the market to replace my MD with a higher end unit. Before I do, I must consider a CDR. I love to MD format & am satisfied with the recording. It sounds close to a cd but not exact.
What I would like to find out is what do people who own a CDR thing of the CDR format & it;s sound quality. How reliable is the CDR, etc.
What do CDR blanks really cost, etc.
Thank you for your time.

PKTerm runs the TNC in host mode, and checks the TNC for correct baud to the computer, so it wouldn't come up and work if it wasn't talking to the TNC.

If you're on LSB, then you need to adjust the DCD knob until the DCD light goes out. You're probably getting random noise and if the DCD light is on all the time in RTTY mode, the PK-232 will decode the noise as characters.

Once the DCD is set to not come on until a signal is heard above the nosie level, you can make sure it's tuning a correct RTTY signal by making sure the tuning indicator leds are blinking as far right and left as possible and centered...

Currently only for those that order it via the Web. But you may be right.
I think the story may be, that the $99 offer will only be good through the
web, and Circuit City will never see another shipment :-)

> Of course this could be expected, and it is their rightful thing to do. It
> is a device that is sold below cost to use with a service that is supposed

The share holders already balked on the New York Times and other
articles about the hacking, and when share price fell, the company
quickly said the new devices can't be hacked. The stock rose a bit
after that.

Netpliance has a new developers page on their web site. They are giving
100 of these away to people who have a good development idea. They
also announced that they are committed to open-source, and want to move
into Linux in a real way.

> Netpliance also stated that they will modify the newly produced units so
> that the published modification is no longer possible. How they will do
> that is unclear, but it seems most likely that the IDE interface will go.

Actually the 16 Meg Flash is all I need for PeeWee Linux.

Reports from people who have got the new ones, are that they are identical
to the old ones. So the news release was mean't to coddle investors, but
since many investors now know the truth, some have complained to the SEC
about possible fraud. One only has to look at Transcrypt to see what
happens to companies that make false statements.

http://biz.yahoo.com/p/t/trii.ob.html

Netpliance reported that the modification would not
cost the company anything. Go figure...

The web page that follows the whole story, is at:

http://i-opener-linux.net/

Try tuning in a Pactor signal -- Pactor is indifferent to whether you
are USB or LSB. If it works, but RTTY will not parse, you are using
the wrong sideband option. RJB.

I visited TNX for good sites.
> "Politicians are the same the world over...
> They promise to build bridges, even where there are no rivers."
> -- Nikita Khruschev
Most politicians start by being lawyers.
Engineers build bridges. Politicians decide where to place them.
Lawyers may let them be built where there are no rivers if a pissing
contest promises to make a future river out of a stream.

Hams need MORE license classes and guidance from engineers who are not
lawyers.

I mean, except for receiving RTTY characters, does the PK232 output the
correct characters to the computer?

> I can say one thing, the tuning meter on the PK 232 is hard to figure out.

That probably means that you don't have the audio input to the PK232
wired up properly. You certainly should be able to light the end LEDs
on the PK232 display by tuning through a *strong* FSK signal.

All benefit by FCC regulations which prevent the spectrum from becoming
chaos. Many Hams learn as they "play".

The FCC must continue to regulate and to enforce its regulation for the
mutual benefit of ALL users. This has nothing to do with profit but
with promoting the general welfare.
>

The government may not benefit from ALL hobbies. Therefore it need not
regulate collectors of Barbie dolls and empty beer cans.

Ham Radio does not depend on taxes or governmernt expendatures. Except for vanity calls our government has decided that Hams should not be charged FCC fees. This is because they have recognized that Ham Radio is a potential asset to the USA and is non-profit.

The primary purpose of our government is neither to make a profit nor to have a loss but to provide for defense, insure the domestic tranquility and promote the general welfare, etc. as mentioned in our constitution.
The basis and purpose of amateur radio is defined in the FCC's Part 97. Ham Radio was originated in the early days of radio, not just as a hobby, but as an endeavor where people could get the practical practice required to attain the skills that were initially required for becoming professional radio operators. These skills included Morse code operation and the ability to set up and maintain amateur radio stations. The Morse requirement is no longer of commercial or military value BUT the technical skills remain...In fact even more so today if hams are to continue to explore modern communication methods. A skilled group of technical communication experts, who have been able to attain practical experience from Ham Radio on a non-profit basis, is of potential value to the USA.
Ham Radio is not a service. Only Hams who volunteer are of service.

All Hams are not amateurs.
To many Hams (but not all): - Ham Radio is an important part of their technical educational experience!

Hams need MORE license classes,
Bob Wex w2ilp (Instruction Links Professionalism)

Ask not what the government can do for Hams.
Ask what Hams have done for the government.
Hams must have done a lot or they wouldn't
have managed to retain their bands thus far.
Lets keep it that way! - Not by gripping but
by trying to maintain our reputation by
keeping up with the state of the art, by
being innovative, and by staying informed.

Fine. The best procedure for you to follow, and leave us alone,
is to file a petition with the FCC. They will respond to that petition,
I guarantee it.

Around here, we just don't care. I'm happy with two classes:
Above 30 MHz and below 30 MHz, with a third class for people
who want to go the extra mile.

I'd rather you designed something and wrote up your experiment
than trying to aspire to becoming a lawyer or legal Ham.

Steve

I went into the local Circuit City just to take a look at it. The card
indicating the price said "contract required". I didn't investigate
further (they only had the demo, of course).

Cecil:

>I mean, except for receiving RTTY characters, does the PK232 output the
> correct characters to the computer?

I guess I'm not sure what you mean. When I'm in the HF mode, there is a split screen blue on top (in my case) and white on the bottom. When I select different modes, RTTY or CW for example, the top (blue) screen reflects my choice, and will say, for example, Baudot or CW.

>That probably means that you don't have the audio input to the PK232
> wired up properly. You certainly should be able to light the end LEDs
> on the PK232 display by tuning through a *strong* FSK signal.

It looks like the extreme end LEDs don't light, but the LEDs next to the end on either side do. But when there is a station, it is very unclear and they all seem to sort of blink - very difficult to tell what is happening.

The audio cable that came with the unit has 1/8" stereo plugs on each end. I am using a Radio Shack "Y" cable that is plugged into the speaker jack, with one "Y" going to the speaker, and the other through an adapter plug that converts the phono plug to the 1/8" plug coming from the Radio 1 input on the back of the PK 232.

I must be getting random noise at times because even when I tune away from
any station, the random letters continue - i.e., it just keeps on typing
gibberish.

> Once the DCD is set to not come on until a signal is heard above the nosie
> level, you can make sure it's tuning a correct RTTY signal by making sure

Then does the DCD light come on in the presence of a signal? Where should
the AF gain be set? I have been setting the threshold to the point where
the DCD light just goes out. Tom W6EIJ

If the DCD lights at all, signals will attempted to be decoded by the TNC. Once the TNC decodes what it 'thinks' is a signal, then it put that out to the program and the program displays it on the screen.

I move the DCD a little higher than noise level, that way, when it signal comes in, that's all that is decoded.

The best way is to use the constant amplitude audio signal
available on the AUX connector on a lot of transceivers.
Sorry, I don't know anything about the Drake.

1508. Remote Sharing of a remote HF Ham Station

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-03 00:00:00 UTC
From: Chris Muir <cmuir@voyager.co.nz>
Message-ID: <BIWF4.61585$3b6.239937@ozemail.com.au>
Source record: 13300

I have been looking at ads for the Kachina, Pegasus, etc to see whether either of these rigs or others provide really convenient cost-effective remote access capabilities so that members of a club for instance could share one really good remote installation and access it with nothing more than a standard i.e. no special hardware other than the usual soundcard, 56k modem, etc (In New Zealand and Australia there are now several ham "mega-sites" that ham clubs have inherited from commercial users with vast antenna farms, Rhombics etc just waiting for this kind of installation!)

It seems to me that the ideal rig for remote control would bundle ALL control signals, PTT, CW keyline and two-way (digitised) audio into a single serial signal which could be piped over standard telephone modems (or over the internet). Put another way, the only connection between the rig and the computer would be an RS-232 connection.

Obviously, this kind of setup could only be used "one at a time" by users but I envisage that the remote HF rig audio might be linked to a UHF transmitter allowing other club members to "listen in".

Here are my questions:

1) Does the Kachina actually work this way? (Or does their system require proprietary modems or other Kachina supplied hardware at the remote end?)

2) Has anyone taken one of the currently available shareware control packages for standard Icom/Yaesu/Kenwood rigs and used a standard sound card to provide the mike/speaker interface? This might even allow what I am looking for to be achieved with a regular rig like the Icom 706, etc.

3) Would a standard dial-up phone line not be better for this kind of activity than the internet? (Saving the cost of an ISP account for the rig site and allowing remote users to connect without needing internet accounts, ISP's etc) Less chance of hackers etc also.

4) One assumes that if the internet were used this implies a permanent virtual connection at the remote rig site via ADSL, cable modem or whatever.

5) Does the Kachina require a PC at the radio end as well as at the remote end? (This would seem to be unnecessary if a dial-up connection were employed?)

5) Are there any standalone modems around that provide concurrent voice and data?

6) Anybody know of a ham club or group that has already implemented such a system for their members?

>Pin 4= PTT
>Pin 5= AGC (0 to 4V Hi-Z)
>Pin 6= NC

Don't connect this directly to a PC! You need to put a MAX232 between the
Serial I/O pins and the serial port on a PC. The CAT transceivers operate
with TTL-level serial signals.

I have no details about that particular transceiver, but in those days the
CAT command set was usually quite limited. So, don't assume that anything
you can do from the frontpanel can be done using CAT.

I have used the same style CAT as available on the FRG-9600 and on the
FT-212 and FT-712, and usually one could only use it to tune the dial and
flip a mode. Memory access and programming was not possible.

I had to read this post by Wexelbaum twice before I could believe my
eyes. I guess some people just have a taste for Big Government.
Well, Wexie, other than pay my taxes, I haven't done jack squat for my
Government lately, and that is the way I like it. The people don't
exist to benefit the Government, the opposite is the case. The
Government did not invent amateur radio, amateur radio operators
invented radio. For some reason, for literally years, you have been
posting essentially the same post, day after day, advocating a
multitude of license classes, together with the notion that all hams
should essentially consider themselves to be servants of the
Government. Nonsense, of course. It is plain that no one is
listening. Could you at least confine such posts to policy, which is
where they belong? This is the digital usenet group.

Yes- it is done all the time. Run a search on 'crystal filter'.

That particular approach usually results in a filter so narrow
that modulation data is distorted. A better approach is to use
two XTALs seperated in frequency by the desired degree of
bandpass.

Crystal filters tend to have very narrow bandwidth. If you want a filter
for wideband FM, then you'll need something else.

1517. Will a GPS provide continuous, accurate altitude measurements?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-03 00:00:00 UTC
From: Dante <dante@theinferno.com>
Message-ID: <Jd4G4.839$s4.117275@petpeeve.ziplink.net>
Source record: 13309

I'd like to be able to drive around in my car, and get a close-to continuous reading on my altitude above sea level. Will a GPS do this? Is it fairly accurate and precise? If not, is there a reasonably priced item that would do this?

What if I interfaced the GPS with something like TOPO USA?

Thanks

1518. Re: Will a GPS provide continuous, accurate altitude measurements?

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <38E8F05C.2BFEB197@swbell.net>
Source record: 13310

GPS altitude data is not terribly accurate. Due to selective availability and the way altitude is determined it can be hundreds of feet off. Using it with TOPO USA will not enhance the accuracy at all. However, if both the GPS and TOPO are using the same datum, it may be somewhat closer.

Check http://joe.mehaffey.com/ for a great source of GPS info.

You won't have to return your IC735 to Icom for reprogramming if
you replace the battery (or if you just let it go dead). That was the
case for some Icom rigs, but not this one. My IC735 is quite a bit
older than yours, and is still on its original battery.

Most handheld GPS receivers aren't very accurate in altitude determination.
An error of 500 feet is not uncommon, depending on the satellite geometry
of the members of the GPS constellation that are visible from your location
at any given moment. A normal altimeter (barometer) would probably serve
your purpose better. Many of the auto accessories places carry them, or
you could get one from an aircraft salvage yard.

Source record: 13313

With selective availability on (reduces accuracy), and using an 8-channel GPS receiver can obtain a horizontal accuracy of 100 meters with a 95% confidence provided that four satellites are in view. That means that there is a 95% chance that you are 100 meters from the reported location. Vertical accuracy is usually 1.5 times the horizontal accuracy, about 173 meters with a 95% confidence. Reasonably priced receivers can have 8 channels for simultaneous comparisons; don't waste your money on channel-switching receivers - they are not worth the drop in price.

With differential GPS you can get down to 10m at 95% confidence, but that requires a dedicated base station. Sub-meter accuracy can be obtained with differential GPS, but only with prolonged recordings - this is for surveying purposes.

Yep, I think the previous suggestion to use an altimeter is a lot better. My watch gives 20 ft accuracy at 95%, about 6 meters.

1527. Yaesu FT767GX CAT Interface HELP

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-03 00:00:00 UTC
From: VE7WVG@Home.Com
Message-ID: <38e7ef53.69859087@News.supernews.com>
Source record: 13394

Can anyone tell me if the CAT connector on my FT767GX is only for interfacing with the Apple II/FIF-65A or can it be directly connected to a PC through the Cat connector or any other means?

If it can be connected to a PC direct (without TNC) can you tell me the pin connections on the PC side of the serial cable? ie: what numbers on the serial cable correspond with the Cat pins numbers?

CAT PIN OUT

Pin 1= GND
Pin 2= Serial out
Pin 3= Serial in
Pin 4= PTT
Pin 5= AGC (0 to 4V Hi-Z)
Pin 6= NC

Also, What software could I use to control my radio from the computer? I've looked at a couple, but no documentation seems to list my Rig, I see the newer rigs listed, the 847, 1000's etc. but nothing for the FT-767GX CAT

I would like to control Frequencies, modes, programming, split VFO, etc. If the software was compatable with some logging software, all the better.....I have tried DX4WIN, but there is no indication as to weather or not it supports my rig or not.

Can anyone Help....If so, Thanks in advance. 73's

By coupling identical hi-Q resonators such as crystals together with
the right amount of coupling, the bandwidth is made wider and can have
the usual butterworth/tchebyshev shapes etc. A certain limit is determined
by the stray parrallel capacitance of the crystals. Using transformers, these
parallel stray effects can be suppressed to make even better filters.

Source record: 13322

Hi everyone. I understand that GPS uses a model of the earth in order to determine the current altitude. If the model ins't very detailed or very accurate then the altitude indicated by the GPS will be inaccurate.

I agree with an earlier posting that suggested using a barometer.
At least one model of Yaesu handheld and one model of Casio watch have barometric features.

1) Get the sea-level pressure setting from a local airport's information (probably an automatic transmission in the 118-136Mhz AM airband - should be easy to get if your 2m hand-held has wideband AM Rx).
2) See what the barometer shows and
3) get your altitude from the difference between the two readings - each milliBar difference indicates a 28' difference.

73, Ian.

ps: You might find more detailed information about GPS altitude and earth models by starting to browse at http://www.nottingham.ac.uk
That university, together with one in Edinburgh, developed an improved model of the earth.

Hello. Many of you may have come across one of the BARTG RTTY contests quite recently.
* Our 48 hour HF RTTY contest is believed to be both the second biggest and also the oldest HF RTTY contest.
* Our annual Sprint contest is also becoming very popular.

>From some of the comments enlsoed with logs for these comtests it seems that many of you do not know that BARTG is more than just a contest.

BARTG - the British Amateur Radio Teledata Group - was founded in 1959 to promote the, then, new mode of RTTY. To-day, RTTY has been joined by many more modes, such as AmTOR, PacTOR, PSK31 (we already offer an award for PSK31) but our aim is the same - to promote datacoms within ham radio.

We're a not-for-profit Group with an international membership. We warmly welcome applications for membership from outside of the UK and our friends in the USA are especially welcome.

You can email our membership secretary at
mailto:members@bartg.demon.co.uk

and you can find out more about us at
http://www.bartg.demon.co.uk

73 from Ian, G4EAN
(BARTG secretary and operator of the BARTG club station - G4ATG)

GPS altitude is not very accurate, it will change at least +/-200 feet while sitting in the same location. An light aircraft altimeter is accurate to within +/-20 feet and assuming a constant error, you would get good relative data while driving around. Might find one that no longer meets spec around your local airport. For all you ever wanted to know about GPS and more, check out the following web site -http://joe.mehaffey.com.

Hope this helps, Hugh KF6HHS

1541. Re: comparison of TNCs (previous post had wrong return email, sorry)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-04 00:00:00 UTC
From: "J. Duffy Beischel" <duffyb01@fuse.net>
Message-ID: <sekptj24eop64@corp.supernews.com>
Source record: 13327

Since we are talking about TNC's, anyone have or know of a TNC control program for the MFJ 1278B OTHER THAN that piece of crap MFJ sells? There SW is full of bugs and needs to be updated. I am very disappointed that they have not come out with any other versions to correct the bugs and add functionality.

Thanks,

Duffy

1542. Wanted Schematics,CAT to RS232 for YAESU FT-767GX

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-04 00:00:00 UTC
From: VE7WVG@Home.Com
Message-ID: <38ea7729.66886680@News.supernews.com>
Source record: 13328

Hello,

I am looking for a schematic diagram for the FIF-232C interface cable
for a Yaesu FT-767GX or would like to purchase a FIF-232C if the price
is right.

Can anyone help?

Thanks in advance

VE7WVG Derek

1543. Windows HAM radio software at http://www.dxsoft.com

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-05 00:00:00 UTC
From: amx@i.am
Message-ID: <8cedrmlap1@nnrp1.deja.com>
Source record: 13329

Hello, OMs!

I want attend your attention to our WWW-site -
"Windows HAM Radio software by the DxSoft grop"

URL is http://www.dxsoft.com

There are next software:

RZ4AG AALog HAM logger
Platform: Windows 3.1x/9x/NT
AALog is a comprehensive logger program designed for
amateur radio station operators. It has convenient
interface, good set of tools, fast and very easy in use. It
look like your paper log an use all power of your
computer. It is able to be integrated with the CW terminal
program CwType, morse decoder CwGet and
RTTY/PSK31 software TrueTTY

UA9OSV TrueTTY - RTTY and PSK31 software
Platform: Windows 9x/NT
Program to receive and transmit RTTY (radioteletype)
and PSK31 (BPSK mode) via sound card. No additional
hardware required - your need only transceiver and
computer with sound card.
Optionally you can use simple circuit for PTT-control.

UA9OSV CwGet morse decoder
Platform: Windows 9x/NT
Program to decode morse code (CW) via sound card. No
additional hardware required - your need only receiver
and computer with sound card.
It is software morse decoder that REALLY work!

UA9OSV CwType morse terminal
Platform: Windows 9x
The terminal program for CW-operators. You can
transmit both from the keyboard and from the paddle
connected to a joystick- or LPT-connector.

Best regards,
Sergei,
UA9OSV
http://www.dxsoft.com

Sent via Deja.com http://www.deja.com/
Before you buy.

I'm going to use it for BPSK demodulation, but maybe it's better to
cascade
a LP with a HP (using two op amps, 2x2 resitors and 2x2 capacitors)? The
problem is that I want to be able to change the received frequency in a
simple way; can the BP filter be syncronized with the local oscillator?

Morgan

The same is true of latitude and longitude. If I use my GPS and laptop map software and sit in one place the spot moves all over the place. I have seen my house move as far as 2 blocks. GPS seems to be fairly good for tracking the location of moving objects, but almost useless for staionary ones. I would expect that altitude would be come more accurate just as lat/long does when moving and thus providing a greater selection of different triangulation data from the satellites.

1547. Timewave DSP-599zx on RTTY - help

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-05 00:00:00 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <zNHG4.4065$g35.141774@newsread1.prod.itd.earthlink.net>
Source record: 13333

A while back, I fooled around with my DSP-599zx on RTTY, using the DSP-RTTY program, also from Timewave. According to the program literature, there was a cable shipped with the software. I no longer have that cable, but connected the 599zx to the PC using a standard 9 pin serial cable. I find that the tx/rx switching works OK, but the tone generated by the 599zx is not modulated by transmitted data and receive data is not displayed. Perhaps this missing cable was of the null modem configuration, where the TX and RX lines are swapped at one end?

I tried using the 599zx with RTTY by WF1B with the same results. Is there anyone out there using the DSP-599zx on RTTY today? If so, please tell me about your cable. Thanks.

I built an interface circuit using an opto-isolator in a DB-25
shell. You need the opto isolator, a few diodes, resistor and two
caps. Seems to work well. I think I have a hand drawn
schematic at home.
This was for a 757GXII, so it should work on the 767GX

Yes, its is called Selective Availability. It is a dither added to the information transmitted by the GPS constellation. There is a way to cancel this deliberate error if your receiver can receive the second channel transmitted by the satellites, and has the decryption key to make use of the information. Ironically, however, the times our forces have actually been in conflicts, SA has been disabled. That's because our military doesn't have sufficient military GPS equipment which can nullify the SA limitations, and has been forced to use civilian GPS receivers in combat.

A good indication that US forces are about to go adventuring has been that your civilian GPS receiver suddenly starts giving more accurate position information. That happened just prior to the Gulf War for example.

Besides, our enemies can just purchase receivers that use the Russian constellation of positioning satellites, which have never used a SA dither to reduce their accuracy. It is an absurd situation when the only ones locked out of better technology are the ones who paid for it (ie the taxpayers).

Meanwhile, while the DOD is dithering our GPS satellites, the FAA is busy installing DGPS transmitters to undo the damage so that our civilian aircraft can accurately navigate. If that isn't an absurd situation, I don't know what is.

There is a similar situation with regard to satellite photo reconnaissance. Our government is trying to prevent us (John Q Public) from buying from Russian and French sources imagery better than it is willing to sell from its own satellites. That isn't denying our enemies anything, unless the government fears that its enemies are its own citizens.

Another similar situation exists with regard to encryption technology. The strongest encryption systems can now only be obtained from foreign sources. That's because our government's absurd policies with regard to encryption have forced development to be moved off shore. Again it is obvious that the government sees its enemies as being its own citizens. Either that, or the government is stupid

beyond belief. (The latter can't be totally discounted.)

Yes, that is true. But of course you can use the (ex?) enemies' system,
which does not have that problem.

Well, that's perfectly predictable when the government is the
instrument used for denying the citizen's inalienable rights
guaranteed by The Constitution.

"The powers not delegated to the United States by the Constitution,
nor prohibited by it to the States, are reserved to the States
respectively, or to the people."

Yeah, right. Why did alcohol prohibition require a Constitutional
ammendment and the prohibition of marijuana doesn't?

Yes it is. That is why it is only good for about 100 meters. The
military can do 10 meters or less. Not too sure what the differance
would be in the Atomic Bombs..hihi..
There are ways to find and calculate the offset for a given place if you
want to take the time.

Source record: 13342

Well it ain't all that bad - though I agree the basic idea of SA would seem to be DOD dumb.

SA provides deliberate random motion that limits your position to 95% of the time within a 100 meter circle. The actual experience would suggest a modern receiver gets 95% within a 50 meter circle. Without SA it would be about 15 or 20 meters.

Various groups including the Coast Guard and amateur radio provide digital correction signals that can cut the error to 5 meters or so.

Various precision techniques can actual lower the error to cms or less.

The FAA program is to provide both en route navigation and precision landing systems. These require both satellite corrections and the use of local ground satellites that provide the accuracy neccessary for enroute or precision approaches. The FAA requirements are not met by the existing systems with or without SA. It is simply not sufficiently safe. It is the ability to determine the safe operation of the system with very high probability that is proving to be the difficult problem.

It is likely that the FAA wide area system will be available for civilian use and will allow a few meter accuracy anywhere in the US or nearby with standard receivers. You will however have to buy a new receiver

While there were supply problems during the Gulf war they have been pretty well overcome and the troops are supplied with military GPSs. These are not necessarily more accurate then civilian units but they are more bullet proof and difficult to fool.

The Russian system is free of SA but consists of only 8 satellites at the moment. It does not appear that the Russians have the will or the resources to maintain it as a viable entry. There is some strong possibility of a European system but it will not be deployed before SA has gone away.

There are presently experiments underway that utilize some new features of the GPS system to allow control of SA in different regions. The intent appears to be to allow SA to be selectively applied where the DOD needs it while removing it from the rest of the world. It may be a while though as it may require the latest version of the satellites.

I will agree the encryption policy is bizarre. Never let cops set policy.

Jim

It is not so. The GPS errors are worse if anything when moving. You may not notice as much and some of the programs cheat - they place you on the road if you are near it - but the actual accuracy is driven by the deliblerate lies about where the satellites are (SA) combined with the physical errors inherent in the system.

There is some degradation at the poles do to the placement of the satellite orbits but other than that the accuracy is much the same everywhere.

Jim

Problem resolved. A newly installed 2 port serial card from CompUSA has incorrect port designations. The output connector identified as for Com A is really that for Comp B and vice versa. This resulted in the port I was using being plugged for the wrong IRQ number. When you do that, you don't get any data transfers, but the transmit/receive control works just fine. A standard 9 pin serial cable works just fine with the DSP-599zx and both of the RTTY programs mentioned.

The accuracy is the same moving or stationary - you just don't notice the error so much when you're moving. GPS with a differential receiver and sitting at a fixed location for a period of time is often used by surveyors to fix a point within millimeters.

1561. Re: TM-D700 tnc features?

The manuals for the TM-D700A are online at:

ftp://216.98.255.24/Amateur/Instruction%20Manuals/

You probably want the Specialized manual at:

ftp://216.98.255.24/Amateur/Instruction%20Manuals/TMD700A_Specialized.pdf

but don't overlook the main manual at:

ftp://216.98.255.24/Amateur/Instruction%20Manuals/TMD700A.pdf

I believe it answers all the questions you ask.

You can find the Acrobat reader at http://www.adobe.com/ if need be.

I have done this. I put a GPS in plot mode on my back deck overnight.
You get a circle about 600 feet in diameter with you in the middle.
DGPS would be the same, except the circle would be only about 60 feet
in diameter.

Such a petition has been filed by other hams who may be more qualified
to do so than you or I. They are Alan Wormser, N5LF, Frederick Adsit,
NY2V and Michael Dinelli, N9BOR. They also want to retain Morse
because they are FISTS members but they have pointed out some of the
same allegations with regard to the technical dumbing down of the April
15th three grade R & O system as I have here and have suggested some of
the same remedies.
>
> Around here, we just don't care. I'm happy with two classes:
> Above 30 MHz and below 30 MHz, with a third class for people
> who want to go the extra mile.

Speak for yourself but don't forget there might be other Hams who would
tend to agree with me... especially among the digital experimenter
types. What are NGs for if not to express differing opinions??? Who
are the "we" who "don't care"??? Those who disagree with me may care
and I can respect their opinions if they have logical reasons, as well
as respect your opinion, weighing the relative merits logically.
As I see it now the R & O has gone too far in the wrong direction.

> I'd rather you designed something and wrote up your experiment
> than trying to aspire to becoming a lawyer or legal Ham.

I am not a lawyer but I hold a BSEE and a MSEd which qualifies me as an
electrical engineer and a teacher. I am presently retired and serve as
a liaison VE.

The GPS satellites broadcast another signal, encrypted, that accounts for the SA degradation. Only the military GPS receivers are capable of receiving and decrypting this signal, hence their accuracy is better. The gov't need not make the civilian system more accurate (or less degraded) when the military is preparing to act... the system is accurate ALL the time, we petty civilians just don't have the means to "understand" it.

It is not really like that. The satellites broadcast two different
signals. The commercial units use one signal, which is further worsened by
SA. The military units use both signals, i.e. a different modulation of the
same signal used by the commercial units, plus a second signal. This
mode is better than the commercial mode even without SA, for some different
reasons (one of them: the two different frequencies allow compensation of
certain propagation effects).

Yes, but the military signal is encrypted and you have to have the key
to use it.

1569. Need help checking out a KAM+ on 1200 baud VHF packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-06 00:00:00 UTC
From: jflanders2@home.com
Message-ID: <38ecf989.349607033@news>
Source record: 13257

I am brand new to VHF packet, and am trying to check out a used KAM+ I just purchased. I have it connected to my FT-847.

I hear a lot of packet activity here (near Augusta, GA) on 145.75, but cannot print a single character of it! I assume it is 1200 baud, but I don't know that for sure. Is it likely to be 9600, which would explain my lack of copy? If so, where can I find 1200 to copy?

The receive LED on the KAM+ lights when I unsquelch the radio (and when the 145.74 packet "noise" breaks the squelch, also). Also, when I do a "connect" command to a fictitious station, the FT-847 seems to transmit OK, so I probably have my KAM+ to FT-847 cable wired up AOK.

Any tips? I just want to make sure everything is working OK.

Well, if it sounds like a 'hisss' -- almost like an unsquelched
FM radio, then it's 9600. If you hear tones
it's 1200. I'm not familiar with the
KAM+, but I run my KPC9612 unsquelched. That is with the
squelch open all the way. Even if the KAM+ can't run unsquelched
opening up the squelch shouldn't affect your receive. There's
a setting for this on the 9612.

(It's possible, but not really certain, that your squelch is
slow, and is cutting off the beginning of packets -- but it's
something to check.)

I agree, that it sounds like it's wired up right, if you see the
'receive LED' light up when you unsquelch. Hmm.

Try listening to 144.390 that's the APRS freq, and you
should hear some activity there at 1200 baud. There isn't
much 9600 in the US, and what little there is, is mostly on
UHF, as inexpensive FM radios are easy to find in that band.

Hello Morgan

Using xtal ladder circuits - it is often easier to produce a narrow CW filter than trying to get the xtals to broadband up to say 3Khz at the 3dB points. For the narrower filter - you do need to have sufficient "Q" in each xtal to begin with.

Best of luck ... Ken

Interesting point. How consistent is the error?? If one were to collect,
say 24 hours worth of position data and then plot the whole thing would it
be likely (possible?) that the center of the plot wold actually reflect your
true and accurate location??

Thanks Steve. I tuned down to 144.39 and am now copying all the
packets I want from the APRS stations.

Sure is curious about the 145.75 stations - they sound exactly the
same as the 144.39 stations to my ear, so they must be 1200 baud also,
but I still cannot copy a thing there.

Tomorrow I will see if I can connect to a station.

Howdy All,

I got a most rude offensive and anonymous letter from some moron taking issue with the way I responded to CQs in past RTTY contests. The letter was postmarked Denver, Colorado perhaps there is a famous RTTY Contest Cop there who sent it.

Instead of trying to Elmer or guide a newbie this twit lambasted me at great length alleging that my style of reply was the subject of much international bru-ha-ha. The interesting thing is that in the EA-WW contest this past weekend I changed the way I reply to a CQ in a way that just happened to address his complaints.

So Mr. Anonymous if you would like to discuss this like a man I'm in the phone book or I'll come up on the frequency of your choice. Your tirade had a lot of questions I'd be happy to address any or all of them. I don't expect to hear from you but perhaps some one else might have an idea what name a sniveling piece of dog crap like yourself goes by.

Count me among the multitude who wish you would confine policy
discussions to policy and not clutter up the digital newsgroup with
your repeated wishes for more Big Government regulation. Since you
are such a technical jock, surely you see the value of a newsgroup
dedicated to the technical aspects of digital, not cluttered up by
your repeated, endless, changeless expressions of desire for more
Government regulation and licensing.

1582. Telephone Keypad Letters?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-07 00:00:00 UTC
From: Ian Wade <Ian.Wade@care4free.net>
Message-ID: <Gih3PGAXjg74Ewj6@care4free.net>
Source record: 13268

For some documentation, I need to check the "standard" assignment of
letters to keys on telephone keypads.

In the UK it looks like this

1
2 ABC
3 DEF
4 GHI
5 JKL
6 MNO
7 PQRS
8 TUV
9 WXYZ
0

Is it any different where you live?

73

Source record: 13269
Body handling: Binary attachment payload not displayed: crahe.vcf

Lancaster, PA, USA
Bell Atlantic

Same except:
7 PRS
9 WXY

No Q or Z

I think this is probably standard US.

The same in the US except there is no Q anywhere. That is on the 7
there is only PRS.

You might try to turn on your PASSALL or whatever Timewave
calls it. With PASSALL on, you will se packets even if they don't
pass the error checking. Also turn your MRES on. You may be
hearing ACK's or other TCP/IP stuff, that is getting masked out.

I suspect 145.75 is a TCP/IP channel, and your settings are such
that you aren't allowing the data to be printed. Which is good
actually, as it will be mostly garbage on the screen.

Just a guess...

Steve
